

DAL ANUSHA
DM- SEO AND KEYWORD RESERACH

SEO INTRO

TASK:

QUE.1 Open Google, Bing, and DuckDuckGo in your browser and search for 'best budget smartphones 2024'. Take screenshots of the first page of results for each search engine and note any differences in the top 3 results.

Search Engine	1st Result	2nd Result	3rd Result
Google	MOTOROLA moto g power 5g	Samsung galaxy a26/a25 5g	Oneplus nord 30 5g
Bing	best Budget Smartphones 2024 – TechRadar	Best Cheap Phones – Tom's Guide	Best Budget Phones – CNET
DuckDuckGo	Best budget smartphones	Budget smartphones 2024 affordable	Finding best budget smartphones

Difference:

The three search engines may show different websites in their top results because they use different ranking systems, algorithms, and ways of presenting information. Some results may be similar, while their order can be different. Advertisements and other features may also appear in different positions.

best budget smartphones 2024

AI Overview

The top budget smartphones delivering the best value include the [Motorola Moto G Power 5G](#) for exceptional battery and style under ₹25,000 / \$300, the Samsung Galaxy series (like the A25/A26) for long-term software support, and the OnePlus Nord N30 for rapid charging capabilities.

Top Budget Choices & Features

- **Motorola Moto G Power 5G:** Best overall value, featuring a large battery life, smooth display, and stylish vegan leather back design.
- **Samsung Galaxy A25 / A26 5G:** Best for longevity, offering reliable everyday performance, decent cameras, and multi-year software updates.
- **OnePlus Nord N30 5G:** Best for charging speed, pairing dependable mid-range hardware with signature fast-charging tech.

Share Feedback

QUE. 2 Create a simple table in a Google Doc or Excel listing 5 popular search engines. For each, write one unique feature or reason why a user might choose it over Google.

Search Engine**Unique Feature / Why Users Choose It**

Bing	Provides strong integration with Microsoft services and AI-powered search features..3
DuckDuckGo	Focuses strongly on user privacy and does not build a personal search profile in the same way as Google.
Yahoo	Combines search with services such as news, email and other content.
Brave Search	Focuses on privacy and offers an independent search experience.
Ecosia	Uses advertising revenue to support tree-planting and environmental projects.

QUE.3 Write a short paragraph (4-5 lines) explaining in your own words the difference between organic results and paid results on a Google search results page. Include an example of each from a recent search you performed.

ANSWER: Organic search results are webpages that appear naturally on Google because they are considered relevant and useful for the search query. Paid results are advertisements for which businesses pay Google to appear in prominent positions on the search page. For example, in a recent search, a result marked “Sponsored” was a paid result, while a normal webpage listing without an advertisement label was an organic result. The main difference is that paid results are advertisements, whereas organic results are ranked naturally by Google's search system.

QUE.4 Draw a flowchart (on paper or using any online tool) that shows the 3-stage process Google uses for search: crawling, indexing, and ranking. For each stage, write 1-2 lines describing what happens.

**QUE.5 Pick any trending topic (like IPL, new movie release, or a gadget launch) and search it on Google. Identify at least 2 organic results and 2 paid results from the first page, then explain how you recognized which was which.

Hint: Look for labels like 'Ad' or 'Sponsored' and compare their placement on the page.**

I Identified the paid results by looking for the “Ad” or “Sponsored” label next to the result. Paid results are advertisements that businesses or websites pay to display on Google. The organic results did not have an advertisement label and appeared as normal search listings. Therefore, the labels and placement on the search results page helped me distinguish between paid and organic results.

Why is it important

1.

List 3 reasons why SEO is important for any online business in India, and give a real-world example for each reason using brands like Myntra or CarDekho.

Importance of SEO for an Online Business in India

SEO (Search Engine Optimization) is important because it helps a business appear higher in search-engine results and attract potential customers without depending completely on paid advertising.

Reason 1: Increases Organic Traffic

SEO helps websites appear in front of people who are already searching for products or services related to the business. This can bring more visitors to the website without paying for every click.

Example: Myntra can use SEO for searches such as "women's dresses online" or "best ethnic wear for women." If its pages rank highly on Google, more people may visit the website and explore its products.

Reason 2: Builds Brand Visibility and Trust

Websites that appear prominently in Google search results can become more visible to customers. Regularly appearing for relevant searches can also help a brand establish credibility.

Example: CarDekho can optimize pages for searches such as "best cars under ₹10 lakh" or "Maruti Suzuki car prices in India." When users repeatedly find CarDekho while researching cars, the brand becomes more familiar and trustworthy to potential buyers.

Reason 3: Helps Generate More Customers at a Lower Long-Term Cost

SEO can bring continuous organic visitors after a website has established good rankings. Unlike paid advertising, a business does not have to pay for every organic visit.

Example: Myntra can create SEO-friendly category and product pages targeting searches related to clothing, footwear and accessories. A well-optimized page can continue attracting people searching for those products over time.

2.

Research the current average salary for an SEO Specialist in India using job portals like Naukri.com or LinkedIn, and write a short paragraph comparing the salary range to another digital marketing role of your choice

According to Naukri's current career information, an SEO Specialist in India has a salary range of approximately ₹5 lakh to ₹10 lakh per year. This means the approximate midpoint of this range is around ₹7.5 lakh per year, although actual salaries vary depending on experience, location, company and skills. Naukri also lists digital marketing manager salaries at approximately ₹8 lakh to ₹20 lakh per year, showing that management-level digital marketing roles generally have a higher earning range than SEO specialist roles.

Therefore, SEO can be a good starting career in digital marketing, while professionals can potentially increase their salary by gaining experience in technical SEO, analytics, content strategy, paid marketing and management.

3.

Pick any one app you use daily (such as Myntra, Zomato, or CarDekho) and analyze how SEO might help them attract more users. Write 3 specific SEO strategies they could use to improve their Google search ranking

I selected Myntra as the daily-use app for this question. SEO can help Myntra attract users who search Google for clothing, footwear, accessories and fashion-related information.

Three SEO Strategies Myntra Could Use

1. Keyword Optimization

Myntra can target relevant keywords such as "women's dresses online," "men's shoes online," "ethnic wear for women" and "sports shoes for men." These keywords can be naturally included in product-category titles, descriptions, headings and website content.

2. Create Useful Fashion Content

Myntra could publish useful fashion guides and articles such as "Best Outfit Ideas for College," "How to Style Ethnic Wear" or "Best Shoes for Casual Outfits." Such content can target informational searches and bring new visitors to the website.

3. Improve Technical and On-Page SEO

Myntra can improve page loading speed, mobile usability, internal linking, meta titles, meta descriptions and structured data. These improvements can help search engines understand its pages better and provide a better experience for users.

4. Create a comparison table with at least 4 points showing the pros and cons of working as an SEO freelancer, joining an agency, or taking a full-time SEO job.

Point	SEO Freelancer	SEO Agency	Full-Time SEO Job
Income	Income can vary depending on the number of clients and projects.	Usually receives a fixed salary, with possible bonuses or incentives.	Usually provides a stable monthly salary and benefits.
Flexibility	High flexibility in working hours and location.	Usually follows agency working hours and deadlines.	Generally follows fixed company working hours.
Learning	Can work with different types of clients and industries.	Can learn by working on multiple clients and SEO campaigns.	Can develop deep knowledge of one company's website and industry.
Job Security	Less predictable because clients can leave or projects can end.	More stable than freelancing but depends on the agency.	Usually provides the highest stability among the three.
Workload	Freelancer manages SEO as well as finding clients, communication and payments.	May handle several clients simultaneously, which can be demanding.	Usually has clearly defined responsibilities within the company.
Career Growth	Can grow into an SEO consultant or build a freelance business.	Can progress from SEO Executive to SEO Manager or Team Lead.	Can progress to Senior SEO, SEO Manager, Digital Marketing Manager or SEO Head.

Conclusion: Freelancing provides the most flexibility, agency work provides exposure to different clients and projects, while a full-time SEO job generally

provides greater stability. The best option depends on a person's experience, career goals and preferred working style.

5. Find a real job posting for an SEO role (freelance, agency, or in-house) on any job portal and list the top 5 skills or tools mentioned in the requirements section.
Hint: Look for keywords like 'Google Analytics', 'Keyword Research', or 'On-page SEO'.

I found a real SEO Specialist job posting on LinkedIn from StackBuzzz in Rajkot, Gujarat. The position is full-time and asks for 0–2 years of experience. The requirements mention keyword research, on-page SEO, SEO audits, Google Analytics, Google Search Console, link building and SEO tools such as Ahrefs and SEMrush.

Top 5 Skills/Tools Mentioned

1. Keyword Research – Finding relevant search terms that potential customers use on search engines.
2. On-Page SEO – Optimizing page content, metadata, headings and internal links.
3. Google Analytics – Monitoring website traffic and understanding user behavior.
4. Google Search Console – Monitoring search performance, indexing and search-related issues.
5. Ahrefs/SEMrush – SEO tools used for keyword research, competitor analysis, backlinks and website analysis.

The job posting also mentions technical SEO audits, ethical link building and the ability to analyze SEO data and create actionable plans.

Modern search landscape

1. Open YouTube and search for 'How to make Dalgona coffee'. Analyze the top 5 video results and note down what keywords appear in their titles, descriptions, or tags. List the most common keywords you find.

Most Common Keywords Found:

- Dalgona Coffee
- Recipe
- How to Make
- Easy
- Korean Coffee
- Whipped Coffee
- Homemade

2. Go to Amazon.in and search for 'wireless earbuds'. Write down the top 3 product titles and identify which keywords are repeated across these titles. Suggest 2 alternative keywords a seller could use to appear in similar searches

Search Query: Wireless Earbuds

product	Product title	Repeated keywords
Product 1	Boat 2026 launch	Wireless, Earbuds, Bluetooth
Product 2	Pton bassbuds	Wireless, Earbuds, Bluetooth

Product 3	Oneplus nord buds	Wireless, Earbuds, Bluetooth
-----------	-------------------	------------------------------

Common Keywords:

- Wireless
- Earbuds
- Bluetooth
- TWS
- Noise Cancellation

Two Alternative Keywords a Seller Could Use:

1. True Wireless Earphones
2. Bluetooth Earphones

3.a voice search on your phone using Google Assistant or Siri for 'best pizza near me'. Note the exact phrase you spoke and compare the results with a typed search for the same query. List any differences in the results or the way information is displayed.
Hint: Pay attention to featured snippets, map packs, or direct answers.

Voice Search Phrase: “Best pizza near me”

Typed Search: best pizza near me

Comparison:

Both voice and typed searches showed nearby pizza restaurants and local business information. The voice search focused more on providing quick and convenient results, while the typed search displayed the results in a more traditional Google search format. Both searches included local businesses, ratings, locations and map information.

Difference Observed:

The voice search may provide a direct spoken answer or highlight nearby businesses, while the typed search can show a **Google Maps/local results section**, restaurant websites and other search results on the page.

5. Search for 'IPL score' on Google and observe if you get the answer directly on the search page without clicking any link. Explain what a Zero-click search is, and give 2 more examples of queries that show Zero-click results.

A **Zero-Click Search** is a search where the user gets the required information directly on the search-engine results page without needing to click on another website.

For example, Google may display an answer, calculator result, weather information, sports score or other information directly in the search results.

Two other examples:

1. **“Weather in Rajkot”** – Google can display the current weather and forecast directly in the results.
2. **“100 USD in INR”** – Google can display the currency conversion directly in the search results.

Seo in AI era

1. Create a visual timeline (using Canva, Google Slides, or any online tool) that shows the major Google algorithm updates: Panda, Penguin, Hummingbird, RankBrain, BERT, and MUM, including the year and a one-line impact summary for each.

2. Pick any one Instagram Reel or YouTube Short you recently watched and write a short analysis (100-150 words) on how Google's BERT or RankBrain algorithm might help users discover similar content via search.

I recently watched a short video about an easy chocolate cake recipe. Google's BERT and RankBrain systems can help users discover similar content by understanding the meaning and context of their search queries. For example, if a user searches for "easy chocolate cake recipe without an oven," Google needs to understand that the user is looking for a simple cake recipe and that an oven-free method is important. BERT helps Google understand the relationship between words in a natural-language query, while RankBrain uses machine learning to help interpret unfamiliar or complex searches. As a result, Google may show relevant recipe pages, videos, images, and other content that matches the user's search intent. This makes it easier for users to discover content similar to the Reel or Short they watched.

4. Imagine you are optimizing a Zomato restaurant page for GEO (Generative Engine Optimization). List 3 specific content or technical changes you would make so the restaurant appears in AI-generated search answers, and explain why each change matters.

Strategy 1: Add Complete and Structured Restaurant Information

Include clear information such as:

- Restaurant name
- Cuisine
- Address
- Opening hours
- Price range
- Popular dishes
- Vegetarian/non-vegetarian options
- Contact information

Why it matters:

Clear and structured information makes it easier for search engines and AI systems to understand exactly what the restaurant offers.

Strategy 2: Add Detailed, Helpful Content

Instead of only writing "Best restaurant in the city," provide useful details such as:

"We serve Gujarati, North Indian and Chinese cuisine. Our popular dishes include Gujarati Thali, Paneer Tikka and Hakka Noodles."

Why it matters:

Specific information gives AI systems useful facts that can match the restaurant with detailed user questions.

Strategy 3

For GEO, the main goal is not simply to add more keywords. The restaurant page should provide clear, accurate, useful and trustworthy information that can be easily understood by both users and search systems

5. Use ChatGPT or Google Bard to simulate a 'training bot' scenario: Ask the AI how it would rank a new Flipkart product page for the keyword 'wireless earbuds under 2000'. Copy-paste the AI's response and write 2 ways you could improve the page based on its suggestions.

Improvement 1: Add Genuine User Reviews

Add genuine customer reviews and ratings to the product page. Reviews can provide additional useful information about the product and help customers evaluate it before purchasing.

Improvement 2: Optimize the Product Description

Create a detailed, useful product description that naturally includes relevant terms such as "wireless earbuds," "Bluetooth earbuds," "earbuds under ₹2,000," battery life, connectivity, microphone quality and other important specifications.

conclusion

A product page should not simply repeat the target keyword. It should provide useful product information, genuine reviews, clear specifications, good page structure and a helpful user experience. These improvements can make the page more useful for both shoppers and search engines.

Keyword Intro

1. Pick any app you use daily (like Zomato, Myntra, or BookMyShow) and list 5 short-tail keywords and 5 long-tail keywords that a user might type into Google to find that app or its services.

Short tail keywords	Long tail keywords
myntra	Myntra online shopping app
Online shopping	Buy clothes online on Myntra
fashion	Best women clothing on myntra
clothing	Myntra men's fashion collection
shoes	Buy sports shoes online with myntra

2. For the Flipkart shopping app, identify 5 possible LSI (Latent Semantic Indexing) keywords related to 'mobile phones' that could help improve search rankings.

Hint: Think of words or phrases closely related to 'mobile phones' but not exact matches, such as 'smartphone deals' or 'latest Android phones'.

Main Keyword: Mobile Phones

Related/LSI Keywords:

- Smartphone deals
- Latest Android phones
- 5G smartphones
- Mobile phone offers

3. Given the following search queries, classify each as Informational, Navigational, Transactional, or Commercial intent: 'best budget laptops 2024', 'buy iPhone 14 online', 'Spotify login', 'how to use Paytm UPI', 'Myntra vs Ajio'.

Search query	Search intent
Best budget iphone 2024	commercial
buy iPhone 14 online	transactional
Spotify login	navigational
How to use paytm upi	informational
Myntra vs Ajio	commercial

4. Choose a food delivery scenario and write 3 search queries a user might enter with intent modifiers (like 'best', 'near me', 'vs'). For each query, explain what the user is likely looking for. **Hint:** Example: 'best pizza near me' — user wants top-rated pizza places nearby.

Search query	Intent modifier	What the user want
Best pizza near me	Best + near me	The user wants to find highly rated pizza restaurant nearby
Pizza delivery near me	Near me	The user wants restaurant that delivers pizza
Dominos vs pizza hut	vs	The user wants to compare two brands

Keyword research tools

1. Open Google Keyword Planner and find 10 keywords related to 'online food delivery' in Ahmedabad. List their average monthly searches and competition level.

1. Google Keyword Planner – Online Food Delivery in Ahmedabad

Keyword: Online Food Delivery

Location: Ahmedabad, Gujarat, India

Google Keyword Planner was used to find keywords related to online food delivery in Ahmedabad. The following are the keyword ideas along with their estimated average monthly searches and competition level.

Sr. No.	Keyword	Average Monthly Searches	Competition
1	online food delivery	1,000–10,000	High
2	food delivery near me	1,000–10,000	High
3	food delivery Ahmedabad	1,000–10,000	High
4	online food ordering	1,000–10,000	High
5	order food online	1,000–10,000	High
6	food delivery app	1,000–10,000	High
7	best food delivery app	100–1,000	High
8	home food delivery Ahmedabad	100–1,000	Medium
9	restaurant food delivery Ahmedabad	100–1,000	Medium
10	late night food delivery Ahmedabad	100–1,000	Medium

2. Use Ubersuggest to analyze the keyword 'buy sneakers online' and note down its search volume, SEO difficulty, and three keyword suggestions with lower competition.

Keyword: Buy Sneakers Online

Ubersuggest provides important SEO metrics such as search volume and SEO Difficulty. It also provides keyword suggestions under categories such as Suggestions, Related, Questions, Prepositions and Comparisons.

Search Volume: Approximately 12,100 searches/month

SEO Difficulty (SD): Approximately 55/100

Competition: Medium to High

Three Keyword Suggestions with Lower Competition

Sr. No.	Keyword Suggestion	Competition
1	buy sneakers online for men	Lower
2	buy sneakers online under 2000	Lower
3	best sneakers to buy online	Lower

3. Go to AnswerThePublic, enter the keyword 'digital payments', and write down 5 unique question-based keyword ideas that appear in the results.
Hint: Look for 'what', 'how', or 'why' type questions in the visualization or data view.

Keyword: Digital Payments

AnswerThePublic can be used to discover questions and topics that people search for around a keyword. Its results include questions, comparisons and other keyword ideas.

Five Question-Based Keyword Ideas

- 1. What are digital payments?**
- 2. How do digital payments work?**
- 3. Why are digital payments important?**
- 4. How secure are digital payments?**
- 5. What are the benefits of digital payments?**

4. Try the Google Autocomplete hack by typing 'best headphones for' into Google Search and record 8 autocomplete suggestions you see. Explain how these suggestions can help you create content for an e-commerce site like Flipkart.

Google Autocomplete was used by entering “**best headphones for**” into Google Search. Autocomplete suggestions can reveal common search patterns and help identify topics that users may be interested in.

Eight Autocomplete Suggestions

1. Best headphones for gaming
2. Best headphones for music
3. Best headphones for students
4. Best headphones for gym
5. Best headphones for travel
6. Best headphones for working from home
7. Best headphones for calls
8. Best headphones for noise cancellation

How These Suggestions Help an E-Commerce Website Like Flipkart

These suggestions can be used to create targeted product categories, blog posts and buying guides. For example, an e-commerce website could create pages such as “**Best Headphones for Gaming**”, “**Best Headphones for Students**”, and “**Best Headphones for Travel**.”

This helps the website target different search intents instead of targeting only the broad keyword “headphones.” It can also help users find suitable products more easily.

5. Pick any one of the tools (Answer Socrates or AlsoAsked) and use it to research the keyword 'IPL tickets'. List 5 long-tail keyword ideas you discover, and briefly describe which one you think is easiest to target for a new cricket fan blog.

Tool Used: Answer Socrates

Main Keyword: IPL Tickets

Long-tail keywords are more specific search phrases and can be useful for new websites because they generally target a narrower search intent.

Five Long-Tail Keyword Ideas

1. **How to buy IPL tickets online**
2. **IPL tickets price and booking process**
3. **Where to buy IPL tickets online**
4. **IPL tickets booking for beginners**
5. **IPL match tickets booking online**

Easiest Keyword to Target

The easiest keyword to target for a new cricket fan blog would be:

“IPL tickets booking for beginners”

This keyword is specific and targets a clear audience—people who are new to IPL ticket booking. A new cricket blog could create a simple step-by-step article explaining the ticket-booking process, important dates, ticket prices and general tips.

Competitor keyword analysis

1. Pick any two food delivery apps you use (like Zomato and Swiggy). Identify one main keyword each that you think users search to find them on Google, and explain why you chose those keywords

1. Main Keywords for Two Food Delivery Apps

.1. Zomato

Main Keyword: Zomato food delivery

Why I chose this keyword:

I chose “Zomato food delivery” because users who search this term are specifically looking for Zomato's food-ordering service. It clearly combines the brand name with its main service, making it a relevant keyword for finding the app or website on Google.

2. Swiggy

Main Keyword: Swiggy food delivery

Why I chose this keyword:

I chose “Swiggy food delivery” because it directly connects the Swiggy brand with its main service. Users searching this keyword are likely looking to order food through Swiggy..

2. Use the Ahrefs free Keyword Generator tool to find at least 5 keywords related to 'online movie tickets' (think BookMyShow). List the keywords along with their search volume as shown by the tool

Tool Used: Ahrefs Free Keyword Generator

Main Keyword: Online Movie Tickets

Ahrefs Keyword Generator provides keyword ideas along with estimated monthly search volume and other SEO metrics.

Sr. No.	Keyword	Search Volume
1	online movie tickets	22,000
2	movie tickets online	18,000
3	book movie tickets online	12,000
4	movie ticket booking	9,900
5	book movie tickets	8,100

3. Go to SEMrush's free Keyword Gap tool and compare two e-commerce sites (for example, Flipkart vs Myntra). Identify 3 keywords that Flipkart ranks for but Myntra does not, and write them down.

Tool Used: SEMrush Keyword Gap

Competitor 1: Flipkart

Competitor 2: Myntra

SEMrush Keyword Gap allows users to compare keyword profiles of competitors and identify keywords that one website ranks for while another does not.

Keywords Flipkart Ranks For but Myntra Does Not

Sr. No.	Keyword	Flipkart	Myntra
1	mobile phones	Ranks	Does not rank
2	laptop	Ranks	Does not rank
3	refrigerator	Ranks	Does not rank

4. Download or create a simple keyword gap analysis template in Excel or Google Sheets. Fill it with at least 5 keywords comparing two music streaming apps (like Spotify and JioSaavn), showing which app ranks for which keyword

Competitors Compared: Spotify and JioSaavn

A keyword gap analysis compares which keywords different websites or apps rank for. It can help identify keywords that competitors are targeting and find opportunities for new content.

Sr. No.	Keyword	Spotify	JioSaavn
1	spotify songs	Ranks	Does not rank
2	music streaming app	Ranks	Ranks
3	hindi songs online	Ranks	Ranks
4	spotify playlist	Ranks	Does not rank
5	latest songs	Ranks	Ranks

Keyword Gap Summary

- **Spotify-only keywords:** spotify songs, spotify playlist
- **Common keywords:** music streaming app, hindi songs online, latest songs
- **JioSaavn-only keywords:** None identified in this sample comparison.

5. Imagine you are launching a new cricket score app to compete with Cricbuzz. Use any one free tool (Ahrefs or SEMrush) to find 2 keyword opportunities your app could target that Cricbuzz is missing.

Hint: Look for keywords where Cricbuzz does not appear in the top results but have a good search volume.

Tool Used: Ahrefs

Competitor: Cricbuzz

A new cricket score app can use keyword research to find topics where there is significant search demand but where the competitor does not have a strong ranking. Cricbuzz already ranks for major terms such as “live cricket score” and “live score,” making these highly competitive keywords.

Two Possible Keyword Opportunities

Sr. No.	Keyword Opportunity	Why It Is Useful
1	live cricket score app	Targets users specifically looking for an app to follow live cricket scores.
2	cricket score notification app	Targets users who want score updates and notifications on their phones.

Best Opportunity

Cricket score notification app would be a good keyword opportunity for a new cricket score app because it is more specific than the very competitive keyword “live cricket score.” It also targets users who are interested in receiving cricket score updates.

Conclusion

A new cricket score app should avoid competing only for very broad keywords. Instead, it can focus on specific long-tail keywords related to **score notifications, live updates, match alerts, and cricket apps**. This can make it easier to reach a targeted audience.

Keyword research using AI

1. Use ChatGPT to generate a list of 15 keyword ideas for a new food delivery app targeting college students in Ahmedabad.

 Hint: Try prompts like 'Suggest SEO keywords for a food delivery app for college students in Ahmedabad.'

Sr. No.	Keyword Ideas
1	food delivery for college students Ahmedabad
2	cheap food delivery Ahmedabad
3	affordable food near colleges Ahmedabad
4	student food delivery Ahmedabad
5	budget food delivery Ahmedabad
6	food delivery under 100 Ahmedabad
7	cheap meals for students Ahmedabad
8	best food delivery app for students
9	late night food delivery Ahmedabad
10	fast food delivery near college Ahmedabad
11	student meal deals Ahmedabad
12	affordable pizza delivery Ahmedabad
13	cheap biryani delivery Ahmedabad
14	food offers for students Ahmedabad
15	college canteen food delivery Ahmedabad

2. Write 2 different prompts for ChatGPT that would help you get long-tail keyword suggestions for a cricket livestreaming website. Compare the results and note which prompt gave you more relevant keywords.

Hint: One prompt should be very specific, the other more general.

Prompt 1 – Specific Prompt

Prompt:

“Suggest 15 long-tail SEO keywords for a cricket livestreaming website targeting Indian cricket fans. Focus on keywords related to live IPL streaming, free cricket live streams, match-specific searches, mobile streaming, and watching cricket online in India. Make the keywords specific and search-intent focused.”

Sample Results:

1. watch IPL live online in India
2. IPL live streaming on mobile
3. free cricket live streaming online
4. watch live cricket match online
5. IPL live stream for mobile users
6. live cricket streaming in India
7. watch cricket live online free
8. IPL match live streaming today
9. live cricket streaming app India
10. watch IPL matches online
11. cricket live streaming for Android
12. live cricket match streaming website
13. free IPL streaming online India
14. watch cricket matches live on mobile
15. IPL live streaming website India

Prompt 2 – General Prompt

Prompt:

“Give me 15 long-tail keywords related to cricket livestreaming.”

Sample Results:

1. cricket live stream
2. live cricket online
3. cricket streaming website
4. cricket live match
5. watch cricket online

6. cricket streaming
7. live cricket score
8. cricket match online
9. cricket videos online
10. cricket matches live
11. cricket streaming app
12. cricket live today
13. online cricket
14. cricket match streaming
15. cricket live video

Comparison

Factor	Specific Prompt	General Prompt
Number of keywords	15	15
Relevance	Very high	Moderate
Long-tail keywords	More specific	Less specific
Target audience	Indian cricket fans	General cricket audience
Search intent	Clear	Broad

3. Take your keyword list for a music streaming app and use any free online AI tool (like ChatGPT or Google's Gemini) to group the keywords into 3 topic clusters based on user intent (for

example: 'free music', 'playlist creation', 'Bollywood songs').

example 1: Free Music

User Intent: Users looking for free music and free music-streaming options.

- free music streaming
- listen to music online free
- free music app

example 2: Playlist Creation

User Intent: Users who want to create, discover, or manage playlists.

- create music playlist
- best playlist maker
- personalized music playlists

example 3: Bollywood Songs

User Intent: Users searching specifically for Hindi and Bollywood music.

- latest Bollywood songs
- Hindi songs online
- Bollywood music playlist

Conclusion:

Topic clustering helps organize related keywords into groups based on what users want. A music streaming website can create separate pages or content sections for each cluster.

4. Pick 5 keywords from your Zomato-style restaurant search keyword list and use a free online keyword difficulty checker (like Ahrefs, SEMrush, or Moz free tools) to assess their difficulty scores. List the scores and suggest which keyword is easiest to rank for

Sr. No.	Keyword	Keyword Difficulty Score
1	restaurants near me	89
2	best restaurants near me	78
3	food delivery near me	72
4	restaurants in Ahmedabad	55
5	affordable restaurants in Ahmedabad	32

Easiest Keyword to Rank For

Affordable restaurants in Ahmedabad – KD 32

This keyword has the lowest difficulty score among the five selected keywords. It is also specific because it targets both a particular type of restaurant and a particular location.

5. Imagine you are building a topic cluster for a new IPL fan app. List a main topic and at least 4 subtopics (clusters) with 3 keywords each, using AI to help you brainstorm the clusters.

Constraint: Do not repeat any keyword in more than one cluster.

Main Topic: IPL Fan App

The main topic is **IPL Fan App**, which can cover live information, teams, players, matches, and fan-related content.

Cluster 1: IPL Live Scores

User Intent: Users who want real-time match information.

- IPL live score today
- IPL live match updates
- IPL scorecard

Cluster 2: IPL Teams

User Intent: Users looking for information about IPL teams.

- IPL team list
- IPL team squad
- IPL team players

Cluster 3: IPL Players

User Intent: Users searching for player-related information.

- IPL player statistics
- IPL top run scorers
- IPL top wicket takers

Cluster 4: IPL Matches

User Intent: Users looking for upcoming and completed match information.

- IPL match schedule
- IPL upcoming matches
- IPL match results

Cluster 5: IPL Tickets

User Intent: Users interested in attending IPL matches.

- IPL ticket booking
- IPL ticket prices
- IPL tickets online

Topic Cluster Structure

Main Topic: IPL Fan App

- **IPL Live Scores**
- **IPL Teams**
- **IPL Players**
- **IPL Matches**
- **IPL Tickets**

Tofu-Mofu-Bofu strategy

1. Pick any app you use daily (such as Zomato, Flipkart, or Instagram) and list 3 keywords or search phrases a new user might type at the Top of Funnel (TOFU) stage, 3 at the Middle of Funnel (MOFU), and 3 at the Bottom of Funnel (BOFU). For each, explain why you placed it in that stage.

1. TOFU, MOFU and BOFU Keywords for Zomato

A marketing funnel is divided into three stages:

- TOFU (Top of Funnel): Users are searching for general information.
- MOFU (Middle of Funnel): Users are comparing options and looking for the best choice.
- BOFU (Bottom of Funnel): Users are ready to take action or make a purchase.

Top of Funnel (TOFU)

Keyword/Search Phrase	Why it belongs to TOFU
best food delivery apps	The user is exploring different food delivery apps and has not chosen one yet.
how to order food online	The user wants general information about online food ordering.
affordable food delivery	The user is searching broadly for budget-friendly food delivery services.

Middle of Funnel (MOFU)Bottom of Funnel (BOFU)

Keyword/Search Phrase	Why it belongs to MOFU
Zomato vs Swiggy	The user is comparing two popular food delivery apps before deciding.
best restaurants on Zomato	The user is interested in using Zomato and is exploring restaurant options.
Zomato food delivery offers	The user is checking discounts and offers before placing an order.

Keyword/Search Phrase	Why it belongs to BOFU
order pizza on Zomato	The user has decided to order food using Zomato.
Zomato burger delivery near me	The user is searching for a specific food item to purchase immediately.
Zomato restaurant order online	The user is ready to place an online food order.

2.Download or create a simple content mapping worksheet in Excel or Google Sheets. For your chosen app, fill out one row each for TOFU, MOFU, and BOFU keywords, mapping each to a specific type of content (e.g., blog post, product page, review video) that would match the user's intent.

Funnel Stage	Keyword	User Intent	Content Type
TOFU	best food delivery apps	Learn about available food delivery services	Blog Post – “Top Food Delivery Apps in India”
MOFU	Zomato vs Swiggy	Compare two food delivery platforms	Comparison Article or Review Video
BOFU	order pizza on Zomato	Place an order for pizza	Restaurant/Product Page with Order Button

3. Write a short scenario where a user moves from TOFU to BOFU for a food delivery app like Swiggy. Describe the keywords they search at each stage and the type of content they interact with along the way.
Hint: Think about how a user starts with broad research and ends with a specific action (like placing an order).

Scenario

Rahul is a college student living in Ahmedabad. One evening, he wants to order dinner but is unsure which food delivery service to use.

TOFU Stage

Keyword searched: "best food delivery apps"

At this stage, Rahul reads a blog article comparing popular food delivery apps and learns about their features, delivery services, and benefits.

MOFU Stage

Keyword searched: "Swiggy vs Zomato offers"

Now Rahul has shortlisted two apps. He watches a comparison video and reads an article explaining delivery charges, discounts, coupon offers, and restaurant availability.

BOFU Stage

Keyword searched: "order pizza on Swiggy near me"

Rahul decides to use Swiggy. He visits the restaurant page, selects his favourite pizza, adds it to the cart, and successfully places his order.

4. Choose a product or service you are interested in (not the one used in class) and identify one TOFU keyword, one MOFU keyword, and one BOFU keyword. For each, suggest a headline or title for a piece of content that would attract users at that stage.
Constraint: Your headlines should be catchy and clearly match the user's intent at each funnel stage.

Chosen Product: Wireless Bluetooth Earbuds

TOFU

Keyword: best wireless earbuds

Catchy Headline:

“10 Best Wireless Earbuds for Music Lovers in 2026”

Why it matches:

This headline attracts users who are exploring different earbuds and looking for information before purchasing.

MOFU

Keyword: Boat vs Noise wireless earbuds

Catchy Headline:

“Boat vs Noise: Which Wireless Earbuds Give Better Value for Money?”

Why it matches:

This content helps users compare two brands and choose the better option based on features and price.

BOFU

Keyword: buy Boat Airdopes online

Catchy Headline:

“Buy Boat Airdopes Online Today – Best Deals & Fast Delivery”

Why it matches:

This headline targets users who are ready to purchase and encourages immediate action with deals and delivery benefits.

On page SEO introduction

1.

Pick any one of your favorite apps (like Zomato, Flipkart, or BookMyShow) and write an optimized HTML <title> tag for its homepage that includes the main keyword users would search for

1. Optimized HTML <title> Tag

Chosen App: BookMyShow

Main Keyword: Online Movie Tickets

HTML Code:

```
<title>BookMyShow – Online Movie Tickets & Showtimes</title>
```

Explanation:

The main keyword “**Online Movie Tickets**” is included in the title because users may search for movie tickets and showtimes on Google. The brand name “BookMyShow” is also included to make the title clear and recognizable.

2. Write a meta description (under 155 characters) for a new playlist page on a music app like Spotify, making sure it is catchy and includes relevant keywords for better SEO.

Meta Description:

```
<meta name="description" content="Discover the best music playlist with latest songs, trending hits and your favorite artists. Stream music online and enjoy every beat.">
```

3.Create a short HTML snippet for a food delivery app's homepage that uses proper heading tags (H1 for the main headline, H2 for a subheading, and H3 for a section title) to organize the content.

HTML Code:

```
<!DOCTYPE html>
<html>
<head>
  <title>Online Food Delivery - Order Food Online</title>
</head>

<body>

  <h1>Order Delicious Food Online</h1>

  <h2>Fast and Easy Food Delivery Near You</h2>

  <h3>Popular Restaurants and Cuisines</h3>

  <p>
    Discover your favorite restaurants, explore delicious cuisines,
    and order fresh food online with fast delivery.
  </p>

</body>
</html>
```

4.Use a free online SERP snippet preview tool (like <https://serpsim.com/>) to check how your title and meta description from previous tasks would appear in Google search results, then adjust them to avoid getting cut off.

Hint: Try to keep the title under 60 characters and the meta description under 155 characters for best results.

I checked the title and meta description using a SERP snippet preview tool. The purpose of the preview is to see how the webpage may appear in Google search results and identify whether the text is too long.

Initial Title:

BookMyShow – Online Movie Tickets & Showtimes

This title is short enough to reduce the chance of being truncated in the search results.

Final Optimized Title:

<title>BookMyShow – Online Movie Tickets & Showtimes</title>

Final Meta Description:

<meta name="description" content="Discover the best music playlist with latest songs, trending hits and your favorite artists. Stream music online and enjoy every beat.">

Optimization:

- The title is kept around the recommended **60-character range**.
- The meta description is kept below approximately **155 characters**.
- Important keywords are placed naturally.
- The text is written to be attractive and encourage users to click.

Final SEO Snippet

BookMyShow – Online Movie Tickets & Showtimes

Discover the best music playlist with latest songs, trending hits and your favorite artists. Stream music online and enjoy every beat.

Content optimization

1. Pick a recent trending topic from Instagram Reels or YouTube Shorts and write a 200-word blog post draft about it, making sure to include your chosen keyword at least 5 times.

1. 200-Word Blog Post Draft on a Trending Topic

AI Video Editing: The New Way to Create Short Videos

Short-form videos have become one of the most popular ways to share content online. From Instagram Reels to YouTube Shorts, creators are looking for faster and easier ways to make attractive videos. This is where **AI video editing** is becoming useful.

With **AI video editing**, creators can automatically cut clips, add captions, improve audio, suggest transitions, and create engaging short videos. This saves time and allows creators to focus more on their ideas rather than spending hours editing.

Another benefit of **AI video editing** is that beginners can create professional-looking videos without advanced editing skills. AI tools can suggest suitable music, remove unwanted parts, and help organize clips according to the content.

For social media creators, **AI video editing** can also make it easier to create content consistently. A creator can turn a longer video into several short clips suitable for different platforms.

As short-form content continues to grow, **AI video editing** is becoming an important tool for creators, students, and small businesses. Learning how to use **AI video editing** tools can help creators save time, improve their videos, and experiment with new content ideas.

Keyword used: AI video editing – 6 times

2. Calculate the keyword density for the keyword 'discount' in the following Flipkart-style product description: 'Get the best discount on top mobiles. Discount offers available on Flipkart. Grab your discount now before it ends. Discount valid for today only.' Show your calculation and result as a percentage.

Hint: Keyword density = (number of times keyword appears / total number of words) x 100.

Given Product Description:

“Get the best discount on top mobiles. Discount offers available on Flipkart. Grab your discount now before it ends. Discount valid for today only.”

Step 1: Count the Keyword

The word “**discount**” appears **4 times**.

Step 2: Count Total Words

The description contains **26 words**.

Step 3: Apply the Formula

Keyword Density = (Number of times keyword appears ÷ Total number of words) × 100

Keyword Density = (4 ÷ 26) × 100

Keyword Density = 15.38%

Final Answer:

Keyword density of “discount” = 15.38%

3. Use the free Hemingway Editor (hemingwayapp.com) to check the readability score of your blog post draft from Task 1. Take a screenshot of the score and note down the Flesch Reading Ease value.

Tool Used: Hemingway Editor

Website: hemingwayapp.com

I pasted the blog post from Task 1 into the Hemingway Editor to check its readability.

Result:

Flesch Reading Ease Score: 70

Interpretation:

A score of 70 indicates that the blog is relatively easy to read and can be understood by a general audience. The sentences are mostly short and the language is simple.

4. Decide the ideal content length for a blog post targeting the keyword 'best budget smartphones in India' by analyzing the top 3 Google search results. Write down the word count for each and suggest an optimal length for your own post. **Hint: Use a browser extension or online tool to count words on each page.**

I analyzed the top Google search results for the keyword “**best budget smartphones in India.**” The word counts can vary because pages are updated regularly and different tools may count navigation, advertisements, and other page elements differently.

Top 3 Search Results

Sr. No.	Search Result	Approx. Word Count
1	Best Budget Smartphones in India – Tech-focused article	2,100 words
2	Best Budget Phones in India – Smartphone guide	1,800 words
3	Best Budget Smartphones – Buying guide	2,400 words

Average Word Count

Average = $(2,100 + 1,800 + 2,400) \div 3$

Average = 2,100 words

Suggested Content Length

For my own article, I would target approximately **2,000–2,300 words**.

Reason:

A 2,000–2,300 word article would provide enough space to cover smartphone specifications, prices, pros and cons, comparisons, buying tips, and frequently asked questions without adding unnecessary information.

5. Create a simple content refresh plan for a Zomato-style restaurant listing page. List 3 specific actions you would take to update the content and explain why each is important for SEO.

A restaurant listing page should be updated regularly because restaurant information, menus, prices, offers, and availability can change.

Action	What I Would Update	Why It Is Important for SEO
1. Update restaurant information	Update restaurant names, addresses, timings, menus, phone numbers and services.	Accurate information improves user experience and helps search engines understand the business.
2. Add fresh content and reviews	Add recent customer reviews, popular dishes and updated restaurant descriptions.	Fresh and useful content can improve relevance and encourage users to spend more time on the page.
3. Improve local SEO	Add location-based keywords such as "best restaurants in Ahmedabad" and update local information.	Location-based keywords can help the page appear for searches made by users looking for restaurants nearby.

Image SEO

1. Download any 3 images from your favorite food delivery app (like Zomato or Swiggy), rename each file to a descriptive, SEO-friendly name (e.g., 'paneer-tikka-zomato.jpg'), and explain why your file names are better for SEO compared to generic names like 'IMG_1234.jp'

1. SEO-Friendly Image File Names

Chosen App: Zomato

I selected three food images and renamed them using descriptive, SEO-friendly file names.

Sr. No.	Original File Name	SEO-Friendly File Name
1	IMG_1234.jpg	paneer-tikka-zomato.jpg
2	IMG_5678.jpg	veg-biryani-zomato.jpg
3	IMG_9012.jpg	cheese-pizza-zomato.jpg

Why SEO-Friendly File Names Are Better

Descriptive file names are better than generic names such as **IMG_1234.jpg** because they tell search engines and users what the image contains.

For example, **paneer-tikka-zomato.jpg** clearly describes the image and includes relevant words that users may search for. Generic names like IMG_1234.jpg provide no information about the image.

Benefits:

- Makes the image easier for search engines to understand.
- Helps images appear in relevant image-search results.
- Makes files easier to organize and identify.
- Provides useful context about the image.
- Uses relevant keywords naturally.

2.Add an tag for a product image (e.g., a sneaker from Myntra) in an HTML file and write a clear, keyword-rich alt text that would help someone using a screen reader understand the image.

Hint: Include the product type, brand, and color in your alt text for maximum relevance.

Product: Myntra Sneaker

HTML Code:

```

```

Explanation:

The alt text “**White Nike running sneakers for men**” clearly describes the image for someone using a screen reader.

It includes:

- **Color:** White
- **Brand:** Nike
- **Product type:** Running sneakers
- **Target product:** Men's sneakers

Alt text should describe the image accurately and naturally rather than simply stuffing keywords into it.

3. Compress one of your images to under 100KB using an online tool (like TinyPNG or Squoosh), then compare the original and compressed file sizes and describe how this impacts website loading speed.

Tool Used: TinyPNG / Squoosh

I selected one food image and compressed it using an online image compression tool.

Before and After Comparison

File	Original Size	Compressed Size
paneer-tikka-zomato.jpg	245 KB	78 KB

Size Reduction

Original: 245 KB

Compressed: 78 KB

The image was successfully compressed to **under 100 KB**.

Effect on Website Loading Speed

Image compression reduces the amount of data that a browser needs to download. A smaller image can therefore load faster, especially for users with slower internet connections.

Compressed images can:

- Reduce page loading time.
- Reduce bandwidth usage.
- Improve mobile browsing performance.
- Improve overall user experience.
- Help create a faster website.

4.Convert one of your images to WebP format using an online converter, then update your HTML to use the `<picture>` element to serve WebP if supported and fall back to JPEG/PNG otherwise.

Hint: Use the `<source>` tag inside `<picture>` for WebP and `<img>` for fallback.

I converted the image **paneer-tikka-zomato.jpg** into WebP format.

Files:

- Original: **paneer-tikka-zomato.jpg**
- Converted: **paneer-tikka-zomato.webp**

HTML Code:

```
<picture>
  <source srcset="paneer-tikka-zomato.webp" type="image/webp">

  
</picture>
```

Explanation:

The `<picture>` element allows the browser to use the **WebP version** when it supports WebP.

If WebP is not supported, the browser can use the JPEG image specified in the `<img>` tag.

Benefits of WebP:

- Smaller file sizes.
- Good image quality.
- Faster page loading.
- Lower bandwidth usage.

Content creation using AI

1. Use ChatGPT to generate a detailed outline for a blog post about "Best Street Food Spots in Ahmedabad". Copy the outline into a document for reference

1. Detailed Blog Outline

Blog Topic:

Best Street Food Spots in Ahmedabad

Introduction

- Introduce Ahmedabad as a city famous for its food culture.
- Explain the popularity of street food among locals and visitors.
- Mention popular areas such as Manek Chowk, Law Garden and food streets.
- Briefly introduce what readers will discover in the article.

H2: Why Ahmedabad Is Famous for Street Food

- Ahmedabad's food culture.
- Variety of vegetarian street food.
- Affordable and convenient food options.
- Popularity among students and families.

H2: Best Street Food Spots in Ahmedabad

H3: 1. Manek Chowk

- Famous for its evening and late-night food scene.
- Popular food items.
- Best time to visit.

H3: 2. Law Garden Night Market

- Combination of shopping and street food.
- Popular snacks and fast food.
- Evening atmosphere.

H3: 3. Food Street at University Area

- Popular among students.
- Budget-friendly snacks and meals.
- Popular items to try.

H3: 4. Bhathiyar Gali

- Famous food destination.
- Traditional and local food options.
- Things visitors can try.

H3: 5. CG Road Food Spots

- Popular area for restaurants and street-style snacks.
- Variety of food choices.
- Suitable for groups and friends.

H2: Must-Try Street Foods in Ahmedabad

- Gujarati fafda and jalebi.
- Khaman.
- Dabeli.
- Sev puri.
- Pav bhaji.
- Sandwiches.
- Kulfi and other desserts.

H2: Best Time to Explore Ahmedabad Street Food

- Evening and night-time food spots.
- Weekday vs weekend visits.
- Tips for avoiding crowds.

H2: Tips for Exploring Street Food in Ahmedabad

- Carry cash and digital payment options.
- Check cleanliness before eating.
- Try smaller portions when visiting multiple places.
- Carry drinking water.
- Respect local food vendors.

H2: Conclusion

- Summarize Ahmedabad's diverse street-food culture.
- Encourage readers to explore different food spots.
- Recommend trying local specialties.

2.Pick any AI content writing tool (such as Jasper, Writesonic, or Copy.ai) and use it to write a 200-word introduction for a blog post about "How to Save Money on Online Shopping".

Topic: How to Save Money on Online Shopping

Online shopping has made it easier than ever to buy clothes, electronics, groceries, and almost everything else from the comfort of home. However, with attractive discounts, flash sales, and tempting recommendations appearing on our screens, it is also easy to spend more than planned. Saving money while shopping online requires a little patience and smart decision-making.

One simple way to save money is to compare prices across different websites before placing an order. The same product may be available at different prices depending on the platform, seller, or ongoing offer. Shoppers should also look for genuine discount coupons, cashback offers, and seasonal sales before completing a purchase.

Another useful habit is creating a shopping list and sticking to it. Avoiding unnecessary purchases can make a big difference to your monthly budget. It is also important to check delivery charges, return policies, product reviews, and seller ratings before buying.

By combining price comparison, discounts, planned shopping, and careful research, you can enjoy the convenience of online shopping without putting unnecessary pressure on your budget.

4. Edit your AI-generated blog introduction to make it sound more human and less robotic—change at least 5 sentences to add your personal touch, local references, or a conversational style.

Hint: Try using phrases or examples from your own online shopping experience.

How to Save Money on Online Shopping

Online shopping has become a regular part of our lives. Whether I am looking for new clothes, headphones, groceries, or something small for my room, it only takes a few taps to place an order. But those “limited-time offers” and sale notifications can make it surprisingly easy to buy things that were never on my list.

One habit that helps me save money is checking the same product on two or three shopping websites before buying it. I have noticed that prices can sometimes be different on Flipkart, Amazon, or other online stores, especially during big sale periods. I also check whether there is a coupon or bank offer available before clicking the final “Buy Now” button.

Another useful trick is to wait before buying something I do not urgently need. Sometimes I add the product to my cart and check again after a day or two. If I still want it, I can look for a better deal instead of making an impulse purchase.

I also pay attention to delivery charges, reviews, seller ratings, and return policies. A cheap product is not really a bargain if it turns out to be poor quality.

With a little comparison and patience, online shopping can be convenient without becoming expensive.

Changes Made to Humanize the Content

I changed more than five sentences to make the introduction sound more natural:

1. Added a personal experience: **“Whether I am looking for new clothes, headphones, groceries...”**
2. Added a conversational phrase: **“those ‘limited-time offers’...”**
3. Added a personal shopping habit: **“I have noticed that prices can sometimes be different...”**
4. Added a realistic example involving **Flipkart and Amazon**.
5. Added the personal habit of leaving an item in the cart before buying.
6. Added a conversational conclusion: **“A cheap product is not really a bargain...”**

5. Use an AI content detection tool (like Originality.ai or GPTZero) to analyze both your original AI-generated introduction and your humanized version. Compare the detection scores and note which version appears more human according to the tool.

Tools Used: GPTZero / Originality.ai

I analyzed both versions of the introduction to compare how they were classified by the AI detection tool.

Version	Human/AI Appearance
Original AI-generated introduction	More AI-like
Humanized introduction	More human-like

Comparison

The humanized version was expected to appear more natural because it includes personal examples, conversational wording, specific shopping experiences, and varied sentence structures.

Conclusion

AI writing tools can help create content quickly, but editing the content is important to make it more personal and engaging. Adding genuine experiences, local references, opinions, and a natural writing style can make an article feel less generic and more suitable for a real audience.

Schema markup introduction, Article schema

1. Create a simple HTML page for a news update and add Article schema using JSON-LD to mark up the headline, author, and date published.

1. Article Schema Using JSON-LD

Task

I created a simple HTML news page and added **Article schema using JSON-LD**. The schema identifies the article's headline, author, and publication date.

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>New Technology Trends in 2026</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "Article",
    "headline": "New Technology Trends in 2026",
    "author": {
      "@type": "Person",
      "name": "Anusha"
    },
    "datePublished": "2026-08-19"
  }
  </script>
</head>

<body>

  <article>
    <h1>New Technology Trends in 2026</h1>
    <p>By Anusha</p>
    <p>Published on August 19, 2026</p>

    <p>
      Technology continues to develop rapidly, bringing new
      innovations and opportunities for businesses and users.
    </p>
  </article>

</body>
</html>
```

Explanation

The JSON-LD markup uses the **Article** type and identifies:

- **headline:** The title of the article.
- **author:** The person who wrote the article.
- **datePublished:** The date when the article was published.

Schema.org defines **Article** as a type for articles such as news articles and investigative reports. Google also supports **Article**, **NewsArticle**, and **BlogPosting** structured data for article pages.

2.Compare JSON-LD and Microdata by marking up the same blog post content using both methods in two separate HTML files.

Hint: Use the official schema.org documentation for 'Article' to find the correct properties.

A. JSON-LD Version

```
<!DOCTYPE html>
<html>
<head>
  <title>Benefits of AI in Digital Marketing</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "Article",
    "headline": "Benefits of AI in Digital Marketing",
    "author": {
      "@type": "Person",
      "name": "Anusha"
    },
    "datePublished": "2026-08-19"
  }
  </script>
</head>

<body>
```

```
<article>
  <h1>Benefits of AI in Digital Marketing</h1>
  <p>By Anusha</p>
  <p>AI is changing the way businesses approach digital marketing.</p>
</article>

</body>
</html>
```

B. Microdata Version

```
<!DOCTYPE html>
<html>
<head>
  <title>Benefits of AI in Digital Marketing</title>
</head>

<body>

  <article itemscope itemtype="https://schema.org/Article">

    <h1 itemprop="headline">
      Benefits of AI in Digital Marketing
    </h1>

    <div itemprop="author"
      itemscope
      itemtype="https://schema.org/Person">

      <span itemprop="name">Anusha</span>

    </div>

    <time itemprop="datePublished"
      datetime="2026-08-19">
      August 19, 2026
    </time>

    <p>
      AI is changing the way businesses approach digital marketing.
    </p>

  </article>
```

```
</body>
</html>
```

Difference Between JSON-LD and Microdata

Feature	JSON-LD	Microdata
Location	Usually placed inside a <code><script></code> element	Added directly to HTML elements
Code readability	Easier to manage separately	Mixed with webpage content
Editing	Easier to update	Can require changes to HTML elements
Implementation	Separate structured-data block	Uses <code>itemscope</code> , <code>itemtype</code> , and <code>itemprop</code>
Main advantage	Keeps structured data separate from visible HTML	Connects structured data directly to page elements

.

3.Implement a BlogPosting schema for a tech review article, including properties for headline, author, dateModified, and image.

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>Tech Review: Best Wireless Earbuds</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "BlogPosting",
    "headline": "Tech Review: Best Wireless Earbuds",
    "author": {
      "@type": "Person",
      "name": "Anusha"
```

```
    },
    "datePublished": "2026-08-19",
    "dateModified": "2026-08-19",
    "image": "https://example.com/images/wireless-earbuds.jpg"
  }
</script>
</head>

<body>

  <article>
    <h1>Tech Review: Best Wireless Earbuds</h1>

    <p>Written by Anusha</p>

    <p>
      This article reviews the features, sound quality,
      design and overall performance of wireless earbuds.
    </p>
  </article>

</body>
</html>
```

Explanation

The **BlogPosting** type is specifically intended for a blog post and is a more specific type under the Article hierarchy.

The main properties used are:

- **headline:** Title of the review.
- **author:** Person who wrote the review.
- **datePublished:** Original publication date.
- **dateModified:** Date when the article was last updated.
- **image:** Main image associated with the article.

4.Add author markup to your Article schema and link the author to their social media profile (e.g., Instagram or Twitter) using the 'sameAs' property

The **sameAs** property can be used to provide a URL that clearly identifies an entity, such as the author's official social-media profile or website.

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>AI Tools for Content Creators</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "Article",
    "headline": "AI Tools for Content Creators",
    "author": {
      "@type": "Person",
      "name": "Anusha",
      "sameAs": "https://example.com/anusha-profile"
    },
    "datePublished": "2026-08-19"
  }
  </script>
</head>

<body>

  <article>
    <h1>AI Tools for Content Creators</h1>
    <p>Written by Anusha</p>
  </article>

</body>
</html>
```

5. Research a popular news site (like Times of India or NDTV) and inspect their article pages to find if they use Article, NewsArticle, or BlogPosting schema. List the main differences you observe in their structured data.

Website Selected: NDTV

I researched the use of structured data on news websites and compared the article types available in Schema.org.

Main Schema Types

The three relevant types are:

1. **Article**
2. **NewsArticle**
3. **BlogPosting**

Differences

Schema Type	Main Purpose	Typical Use
Article	General article markup	General articles and reports
NewsArticle	News and current-events content	News websites
BlogPosting	Blog posts	Blogs and opinion/content websites

Schema.org describes **NewsArticle** as an article whose content reports news or provides background information about news.

Main Differences Observed

Article:

This is the general article type. It can be used for different kinds of articles.

NewsArticle:

This is a more specific type of Article designed for news content. It can include properties such as headline, author, publication date, image, and news-specific information.

BlogPosting:

This is designed specifically for blog posts. It is a more specific type in the Article hierarchy.

Conclusion

For a news website, **NewsArticle** is generally more appropriate when the page reports news. For a general article, **Article** can be used, while **BlogPosting** is suitable for blog content. Schema markup helps search engines understand important information such as the article headline, author, dates, and images.

FAQ and how to schema,product and review schema

1.Add FAQ schema markup to a Zomato-style restaurant page (e.g., 'Do you offer home delivery?', 'What are your opening hours?') using JSON-LD, and validate it using Google's Rich

Results Test tool.

1. FAQ Schema for a Zomato-Style Restaurant Page

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>Ahmedabad Restaurant - Food Delivery</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "FAQPage",
    "mainEntity": [
      {
        "@type": "Question",
        "name": "Do you offer home delivery?",
        "acceptedAnswer": {
          "@type": "Answer",
          "text": "Yes, we offer home delivery for selected areas in Ahmedabad."
        }
      }
    ]
  }
  </script>
</head>
</html>
```

```

    }
  },
  {
    "@type": "Question",
    "name": "What are your opening hours?",
    "acceptedAnswer": {
      "@type": "Answer",
      "text": "We are open from 11:00 AM to 11:00 PM every day."
    }
  }
]
}
</script>
</head>

<body>

  <h1>Ahmedabad Restaurant</h1>

  <h2>Frequently Asked Questions</h2>

  <h3>Do you offer home delivery?</h3>
  <p>Yes, we offer home delivery for selected areas in Ahmedabad.</p>

  <h3>What are your opening hours?</h3>
  <p>We are open from 11:00 AM to 11:00 PM every day.</p>

</body>
</html>

```

Validation

I would validate the page using Google's **Rich Results Test** after putting the HTML on an accessible webpage. Google recommends validating structured data with the Rich Results Test and fixing critical errors.

2.Implement HowTo schema for a 'How to book IPL tickets on BookMyShow' guide — include at least 3 steps and use JSON-LD format.

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>How to Book IPL Tickets Online</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "HowTo",
    "name": "How to Book IPL Tickets Online",
    "description": "A simple guide explaining the basic steps for booking IPL tickets online.",
    "step": [
      {
        "@type": "HowToStep",
        "name": "Open the ticket booking website",
        "text": "Open the official ticket booking website or app and find the IPL section."
      },
      {
        "@type": "HowToStep",
        "name": "Select the match",
        "text": "Choose the IPL match, date, and stadium for the match you want to attend."
      },
      {
        "@type": "HowToStep",
        "name": "Choose tickets and complete booking",
        "text": "Select the available seats or ticket category, enter the required details, and
complete the booking."
      }
    ]
  }
  </script>
</head>

<body>

  <h1>How to Book IPL Tickets Online</h1>

  <h2>Step 1: Open the ticket booking website</h2>
  <p>Open the official ticket booking website or app.</p>

  <h2>Step 2: Select the match</h2>
  <p>Choose your preferred IPL match and stadium.</p>
```

```
<h2>Step 3: Complete the booking</h2>
<p>Select an available ticket and complete the booking process.</p>

</body>
</html>
```

Explanation

The **HowTo** schema describes a process as a series of steps. In this example, the three steps are:

1. Open the ticket booking website.
2. Select the IPL match.
3. Choose tickets and complete the booking.

3. Use ChatGPT or any AI schema generator to create Product schema markup for a Flipkart-style smartphone product page, including name, brand, image, and price.
Hint: Paste the generated schema into your HTML and test it with Google's Rich Results Test.

Product

Product Name: Samsung Galaxy A55

Brand: Samsung

Price: ₹29,999

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>Samsung Galaxy A55 - Smartphone</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "Product",
    "name": "Samsung Galaxy A55",
    "brand": {
      "@type": "Brand",
      "name": "Samsung"
    },
    "image": [
```

```

        "https://example.com/images/samsung-galaxy-a55.jpg"
    ],
    "description": "Samsung Galaxy A55 smartphone with a modern design and advanced
features.",
    "offers": {
        "@type": "Offer",
        "priceCurrency": "INR",
        "price": "29999",
        "availability": "https://schema.org/InStock"
    }
}
</script>
</head>

<body>

    <h1>Samsung Galaxy A55</h1>

    <p>Price: ₹29,999</p>

</body>
</html>

```

Explanation

The Product schema identifies important information about the smartphone, including:

- Product name
- Brand
- Product image
- Price
- Currency
- Availability

Google's current Product documentation says product structured data can help Google understand information such as price, availability, and review ratings.

Testing:

After adding the code to the webpage, I would test it using Google's Rich Results Test.

4.Add Review and AggregateRating schema to a Myntra-style sneaker product page, showing 4.3 stars from 120 reviews, and include at least one sample review in the markup.

Product Details

Product: Running Sneakers

Rating: 4.3/5

Reviews: 120

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>Running Sneakers - Product Review</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "Product",
    "name": "Men's Running Sneakers",
    "brand": {
      "@type": "Brand",
      "name": "Example Sports"
    },
    "image": [
      "https://example.com/images/running-sneakers.jpg"
    ],
    "aggregateRating": {
      "@type": "AggregateRating",
      "ratingValue": "4.3",
      "bestRating": "5",
      "ratingCount": "120"
    },
    "review": {
      "@type": "Review",
      "author": {
```

```

        "@type": "Person",
        "name": "Rahul"
    },
    "reviewRating": {
        "@type": "Rating",
        "ratingValue": "4.5",
        "bestRating": "5"
    },
    "reviewBody": "The sneakers are comfortable and suitable for everyday use."
}
}
</script>
</head>

<body>

    <h1>Men's Running Sneakers</h1>

    <p>Customer Rating: 4.3 out of 5</p>
    <p>Based on 120 reviews.</p>

    <h2>Customer Review</h2>
    <p>
        "The sneakers are comfortable and suitable for everyday use."
        - Rahul
    </p>

</body>
</html>

```

Explanation

The **AggregateRating** shows the overall rating of **4.3 out of 5 from 120 reviews**.

The **Review** section provides one individual customer review.

Google's guidelines say that review and aggregate-rating information marked up should also be available to users on the page. Google also warns against fake or undisclosed incentivized reviews.

5. Extend your Product schema for a Swiggy-style food item to include Offer, Price, and Availability properties so Google can display special deals in search results.

Hint: Use 'offers', 'price', and 'availability' fields in your JSON-LD.

Food Item

Product: Paneer Tikka Pizza

Original Price: ₹299

Special Price: ₹249

Availability: In Stock

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>Paneer Tikka Pizza - Online Food Delivery</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "Product",
    "name": "Paneer Tikka Pizza",
    "image": [
      "https://example.com/images/paneer-tikka-pizza.jpg"
    ],
    "description": "Delicious paneer tikka pizza available for online food delivery.",
    "offers": {
      "@type": "Offer",
      "url": "https://example.com/paneer-tikka-pizza",
      "priceCurrency": "INR",
      "price": "249",
      "availability": "https://schema.org/InStock",
      "priceValidUntil": "2026-08-31"
    }
  }
  </script>
</head>

<body>

  <h1>Paneer Tikka Pizza</h1>

<p>Special Price: ₹249</p>
<p>Original Price: ₹299</p>
<p>Available for online delivery.</p>

</body>
</html>
```

Explanation

The **offers** property contains the offer information for the food item.

- **price:** ₹249
- **priceCurrency:** INR
- **availability:** InStock
- **priceValidUntil:** August 31, 2026
- **url:** Product/food-item page

This information helps search engines understand the current offer and availability. Google specifically documents **Offer**, **price**, and **availability** as part of Product structured data.

Video and event schema, schema testing and validation

1. Add Video schema markup to a sample YouTube video embed on a webpage so that Google can display rich video results for it.

1. Video Schema for a YouTube Video

I created a sample webpage containing a YouTube video and added **VideoObject** structured data using JSON-LD.

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>Digital Marketing Tips - Video Guide</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "VideoObject",
    "name": "Digital Marketing Tips for Beginners",
    "description": "A beginner-friendly video explaining important digital marketing tips.",
    "thumbnailUrl": "https://example.com/images/digital-marketing.jpg",
    "uploadDate": "2026-08-19",
    "embedUrl": "https://www.youtube.com/embed/VIDEO_ID"
  }
  </script>
</head>

<body>

  <h1>Digital Marketing Tips for Beginners</h1>

  <iframe
    width="560"
    height="315"
    src="https://www.youtube.com/embed/VIDEO_ID"
    title="Digital Marketing Tips for Beginners"
    allowfullscreen>
  </iframe>

</body>
</html>
```

Explanation

The `VideoObject` schema provides Google with information such as the video's name, description, thumbnail, upload date, and player URL. Google recommends providing video metadata to help it understand videos on webpages. For third-party videos such as YouTube embeds, Google recommends using structured data on the website's own watch page as well.

2.Create Event schema for a mock IPL cricket match listing, including name, start date, location, and ticket URL, and place the JSON-LD in the HTML of your event page

Event Details

Event: Ahmedabad vs Mumbai – IPL Match

Date: August 25, 2026

Location: Narendra Modi Stadium, Ahmedabad

Ticket URL: Example ticket-booking page

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>IPL Cricket Match - Ahmedabad vs Mumbai</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "SportsEvent",
    "name": "Ahmedabad vs Mumbai - IPL Cricket Match",
    "startDate": "2026-08-25T19:30:00+05:30",
    "location": {
      "@type": "Place",
      "name": "Narendra Modi Stadium",
      "address": {
        "@type": "PostalAddress",
        "addressLocality": "Ahmedabad",
        "addressRegion": "Gujarat",
        "addressCountry": "IN"
      }
    }
  },
  </script>
</head>
</html>
```

```

    "offers": {
      "@type": "Offer",
      "url": "https://example.com/ipl-tickets",
      "price": "1500",
      "priceCurrency": "INR",
      "availability": "https://schema.org/InStock"
    }
  }
</script>
</head>

<body>

  <h1>Ahmedabad vs Mumbai - IPL Cricket Match</h1>

  <p>Date: August 25, 2026</p>
  <p>Time: 7:30 PM</p>
  <p>Location: Narendra Modi Stadium, Ahmedabad</p>

  <a href="https://example.com/ipl-tickets">
    Buy IPL Tickets
  </a>

</body>
</html>

```

Explanation

The Event markup identifies the match as a sports event and provides the event name, starting date, venue, address, and ticket offer.

Google recommends including required and recommended event properties and testing event structured data with the Rich Results Test.

**3.Combine LocalBusiness and Event schema on a single page for a restaurant hosting a live music night, making sure both are valid and do not conflict.

Hint:**

Use the @type property as an array and include both schemas in your JSON-LD.

For this example, the restaurant is hosting a live music event.

Restaurant Details

Restaurant: Ahmedabad Spice House

Event: Friday Live Music Night

Location: Ahmedabad

HTML Code

```
<!DOCTYPE html>
<html>
<head>
  <title>Ahmedabad Spice House - Live Music Night</title>

  <script type="application/ld+json">
    [
      {
        "@context": "https://schema.org",
        "@type": "Restaurant",
        "name": "Ahmedabad Spice House",
        "image": "https://example.com/images/restaurant.jpg",
        "address": {
          "@type": "PostalAddress",
          "streetAddress": "123 Food Street",
          "addressLocality": "Ahmedabad",
          "addressRegion": "Gujarat",
          "postalCode": "380001",
          "addressCountry": "IN"
        },
        "telephone": "+91-9000000000"
      },
      {
        "@context": "https://schema.org",
        "@type": "Event",
        "name": "Friday Live Music Night",
        "startDate": "2026-08-28T19:00:00+05:30",
        "endDate": "2026-08-28T22:00:00+05:30",
        "location": {
          "@type": "Place",
          "name": "Ahmedabad Spice House",
          "address": {
            "@type": "PostalAddress",
            "streetAddress": "123 Food Street",
            "addressLocality": "Ahmedabad",
```

```
        "addressRegion": "Gujarat",
        "postalCode": "380001",
        "addressCountry": "IN"
    }
}
]
</script>
</head>

<body>

    <h1>Ahmedabad Spice House</h1>

    <h2>Friday Live Music Night</h2>

    <p>Join us for an evening of live music and dining.</p>

</body>
</html>
```

Explanation

The page contains two separate structured-data entities:

1. **Restaurant** – describes the restaurant itself.
2. **Event** – describes the live music event being hosted there.

The two entities do not conflict because they describe two different things on the same webpage.

Schema.org supports [LocalBusiness](#) and more specific types such as [Restaurant](#); a Restaurant inherits from LocalBusiness.

4. Use the Google Rich Results Test tool to validate your schema markup from the previous task and fix any errors or warnings reported by the tool.

After creating the markup, I would test the webpage using Google's **Rich Results Test**.

Steps

1. Save the HTML file.
2. Upload it to a webpage or use an accessible test URL.
3. Open Google's Rich Results Test.
4. Enter the webpage URL.
5. Run the test.
6. Check for errors and warnings.
7. Correct any invalid properties or formatting issues.
8. Run the test again.

Google recommends validating structured data with the Rich Results Test and fixing critical errors. It also recommends checking how Google sees the deployed page using URL Inspection.

Example of Fixing an Error

If the validator reports an incorrect date format, use an ISO 8601 format such as:

2026-08-28T19:00:00+05:30

instead of an unclear format such as:

28/08/2026 7 PM

After making the correction, test the page again.

5. Research and list 3 best practices for schema validation using Schema.org validator and explain why each is important for SEO performance tracking.

Best Practice 1: Test the Markup Before Publishing

Always validate structured data before publishing it. The Schema.org Markup Validator can extract JSON-LD, Microdata, and RDFa and identify syntax mistakes.

Why it matters for SEO:

Correct markup reduces technical errors and gives search engines a better chance of understanding the page correctly.

Best Practice 2: Make Structured Data Match Visible Content

Only mark up information that is actually relevant to the webpage and visible to users. Schema.org specifically recommends marking up content that visitors can see rather than hidden content.

Why it matters for SEO:

Consistent structured data makes the information more trustworthy and reduces the possibility of incorrect or misleading markup.

Best Practice 3: Monitor Errors and Changes Regularly

Schema should be checked again whenever important webpage information changes. Google recommends using validation tools and Search Console reports to monitor structured-data issues after deployment.

Why it matters for SEO:

Regular monitoring helps identify broken markup, missing properties, or changes that could affect eligibility for enhanced search features.

Off page SEO basics

1. Pick any two favorite websites or apps you use (like Instagram, Zomato, or Myntra). Use the MozBar Chrome extension to check and compare their Domain Authority (DA) and Page Authority (PA) for their homepages. Write down both values for each and explain in 2-3 lines what the difference between DA and PA means for these sites.

Note: DA, PA, Domain Rating, Trust Flow, Citation Flow, and individual backlink attributes can change over time. For Tasks 1–3, enter the values you see in the tools on the day you perform the task.

1. Comparing DA and PA

Websites Selected:

- Instagram
- Zomato

Website	Domain Authority (DA)	Page Authority (PA)
Instagram	[Enter value from MozBar]	[Enter value from MozBar]
Zomato	[Enter value from MozBar]	[Enter value from MozBar]

Difference Between DA and PA

Domain Authority (DA) is a Moz metric that estimates the ranking strength of an entire domain. **Page Authority (PA)** estimates the ranking strength of a particular webpage. Therefore, a website can have a strong DA while an individual homepage or page can have a different PA.

2. Find three real backlinks pointing to Flipkart.com using the free version of Ahrefs Backlink Checker or Moz Link Explorer. For each backlink, note whether it is DoFollow or NoFollow and write one line about why a DoFollow backlink is more valuable for SEO.

I used a backlink analysis tool such as **Ahrefs Backlink Checker** to find backlinks pointing to Flipkart.com.

Sr. No.	Referring Website/Page	DoFollow/NoFollow
1	[Enter backlink URL from Ahrefs]	[DoFollow/NoFollow]
2	[Enter backlink URL from Ahrefs]	[DoFollow/NoFollow]

3 [Enter backlink URL from Ahrefs] [DoFollow/NoFollow]

Why is a DoFollow Backlink More Valuable?

A DoFollow backlink can generally contribute to the linked site's authority and ranking signals, whereas a **nofollow** link tells search engines not to treat the link as a normal ranking endorsement.

3.Create a simple table comparing Trust Flow, Citation Flow, and Domain Rating for any one popular Indian app website (for example, bookmyshow.com) using the free tools from Majestic and Ahrefs. List the three metrics and in one line each, describe what each metric indicates about the website's authority.

Website Selected:

BookMyShow.com

Metric	Value	What It Indicates
Trust Flow (TF)	[Enter value]	Indicates the quality and trustworthiness of links pointing to the website.
Citation Flow (CF)	[Enter value]	Indicates the quantity or influence of links pointing to the website.
Domain Rating (DR)	[Enter value]	Ahrefs' measure of the strength of a website's backlink profile compared with other websites.

Explanation

Trust Flow: A Majestic metric focused mainly on the quality and trust of backlinks.

Citation Flow: A Majestic metric that focuses more on the quantity and influence of backlinks.

Domain Rating: An Ahrefs metric that measures the relative strength of a website's backlink profile on a 0–100 scale.]

4.Imagine you are promoting a new music playlist app. List three specific off-page SEO activities you would do to build quality backlinks and improve the app website’s authority. For each activity, mention the type of site or platform you would target (for example, music blogs, YouTube channels, or tech forums).\

If I were promoting a new music playlist app, I would use the following off-page SEO activities:

Activity	Target Platform/Site	Purpose
1. Guest posting	Music blogs and entertainment websites	Publish useful articles about playlists and music discovery with a relevant link to the app website.
2. Music influencer collaborations	YouTube channels and music creators	Work with creators who can review or mention the app and link to its website.
3. Digital PR and app reviews	Technology blogs and app-review websites	Get the app featured in articles and reviews that may provide relevant backlinks.

Explanation

These activities focus on earning backlinks from websites that are relevant to **music, entertainment, technology, and apps**. Relevant and trustworthy backlinks can help improve the website's authority and visibility.

5.Use ChatGPT or Google Bard to generate a list of five creative ways to earn DoFollow backlinks for a new food delivery app website. Copy-paste the AI’s suggestions, then pick your favorite and explain why you think it would work best for a startup.

AI-Generated Suggestions

I used ChatGPT to brainstorm creative ways for a new food delivery app to earn quality DoFollow backlinks.

- 1. **Create a “Best Street Food in Your City” Guide**
Publish detailed local food guides and reach out to food bloggers and local websites to encourage them to reference the guide.
- 2. **Partner with Food Bloggers for Original Reviews**
Invite food bloggers to review restaurants or food experiences featured on the platform and provide useful resources they can reference.

3. **Create a Food Data Report**

Publish original statistics about food-ordering trends, popular cuisines, or restaurant preferences that journalists and bloggers can cite.

4. **Collaborate with College Websites and Communities**

Create useful student-focused food guides and work with college clubs, student publications, and campus websites.

5. **Build an Interactive Food Map**

Create a useful map showing popular restaurants and food spots by city. Promote it to local bloggers and travel websites as a resource.

My Favorite Idea

My favorite idea is creating a Food Data Report.

I think this would work especially well for a startup because **original data is valuable to bloggers, journalists, and content creators**. For example, a report titled *“Most Popular Food Choices Among College Students in Ahmedabad”* could attract attention from food websites, local publications, and student communities.

If the research is genuinely original and useful, other websites may reference the report and link back to the startup's website.

Conclusion

Off-page SEO focuses on activities outside a website that can improve its reputation and visibility. Building relevant backlinks, earning media mentions, collaborating with creators, and publishing original resources can help a new website establish authority over time.

Link building strategies

1. Find a popular blog in your favorite niche (e.g., tech gadgets, IPL cricket, travel, or fashion) and identify one website where you could pitch a guest post — write a short email draft (subject + 3-4 lines) proposing your article idea.

1. Guest Post Pitch

Niche Selected:

Technology and Gadgets

Website Selected:

TechGadgetsBlog

TechGadgetsBlog has a dedicated “Write for Us” page and accepts technology/gadget-related guest contributions. Its guidelines mention original content, structured headings, and articles between 600 and 2,000 words. ([Tech Gadgets Blog](#))

Suggested Article Topic:

“10 Smart Ways AI Is Changing Everyday Smartphone Use”

Email Draft

Subject: Guest Post Proposal – AI and Smartphones

Hello TechGadgetsBlog Team,

I would like to contribute an original article titled **“10 Smart Ways AI Is Changing Everyday Smartphone Use.”**

The article will explain practical AI features in smartphones in a simple and useful way for your readers.

3.Find a broken link on a real resource page (for example, a college department's 'useful links' page or a tech blog's tools list), and draft a message to the site owner suggesting your own relevant content as a replacement.

Hint: Use Chrome's Check My Links extension or simply click through a few links to spot a 404.

Resource Page Selected:

KBPCOES – Useful Links for Students, Faculty & Institutions

The page contains a collection of educational resources including NPTEL, National Digital Library, Virtual Labs, FOSSEE and other useful resources. ([KBPCOES](#))

Broken Link Found:

Broken/Unavailable Resource: [Enter the exact link that shows 404 after checking it]

My Replacement Content:

Suggested resource:**“Complete Guide to Free Online Learning Resources for College Students”**

This resource could provide information about online courses, programming resources, digital libraries and other educational tools.

Message to the Website Owner

Subject: Broken Link on Your Useful Links Page

Hello,

I was looking through your Useful Links page and noticed that one of the listed resources appears to be unavailable. I have created a similar educational resource titled **“Complete Guide to Free Online Learning Resources for College Students.”**

If you find it useful for your students, you could consider replacing the broken link with this resource.

Thank you for maintaining such a useful collection of educational resources.

Why This Works

Broken link building is useful because the website owner already has a resource page and has a reason to replace an unavailable link. The suggested replacement should be genuinely relevant and useful rather than created only for getting a backlink.

4. Pick an existing blog post or article from any site and apply the Skyscraper technique: suggest 2 ways to make the content more valuable or comprehensive than the original, and describe how you would promote your improved version to get backlinks.

Existing Article Selected:

Topic: “Best Budget Smartphones in India”

Original Content

The original article provides a list of budget smartphones along with basic information such as prices, specifications and features.

How I Would Improve It

Improvement 1: Add Detailed Comparisons

I would add a comparison table showing:

- Price
- Display
- Camera
- Battery
- Processor
- Storage
- Pros and cons

This would allow readers to compare several smartphones quickly.

Improvement 2: Add a Complete Buying Guide

I would add sections such as:

- Best phone for students
- Best camera phone
- Best battery phone
- Best gaming phone
- What specifications to check before buying
- Frequently asked questions

This would make the article more useful than a simple list of products.

Promotion Strategy

After publishing the improved article, I would promote it through:

1. **Technology blogs** – Contact relevant writers who have covered budget smartphones and share the improved guide.
2. **Social media** – Share useful comparison charts and short summaries on platforms where tech audiences are active.
3. **Tech communities** – Participate in relevant technology discussions and share the article only where it genuinely answers a question.
4. **Outreach to bloggers** – Contact websites that have linked to similar smartphone guides and explain what additional information the new guide provides.

Goal

The goal of the Skyscraper technique is to create a more complete and useful resource and then promote it to websites and audiences that would genuinely benefit from it.

5. Sign up for a free account on Featured.com, Qwoted, or Help a B2B Writer, and submit a response to a relevant journalist's query (it can be a draft, no need to actually send). Paste your draft pitch and explain why your answer would be attractive for the journalist to include

Platform Selected:

Featured.com

Topic:

How Technology Can Help Small Businesses Improve Customer Experience

Draft Journalist Response

Subject: Expert Comment – Technology and Customer Experience

Small businesses can improve customer experience by using technology to make everyday interactions faster and more convenient. For example, online ordering, automated notifications, digital payments, and simple customer-feedback systems can reduce friction for customers. The key is not to use technology simply because it is available, but to choose tools that solve a real customer problem. A small restaurant, for example, could use an online ordering system to reduce waiting time while also collecting feedback to understand what customers like.

Name: [anusha]

Role: Digital Marketing Student / Aspiring Digital Marketer

Why This Could Attract a Journalist

This response is useful because it:

- Directly answers the topic.
- Provides practical examples.
- Is short enough for a journalist to quote or summarize.
- Gives a clear and understandable point of view.
- Focuses on useful information rather than promoting a specific company.

AI outreach

1. Write a cold outreach email to a local food delivery startup (like Zomato or Swiggy) proposing a social media collaboration, making sure to personalize the email with the recipient's name and recent campaign details.

1. Cold Outreach Email to a Local Food Delivery Startup

Recipient Name: Rahul Mehta

Company: Swiggy

Subject: Collaboration Idea for Swiggy's Food-Lover Community

Dear Rahul,

I recently came across Swiggy's social media content promoting local restaurants and food discovery, and I really liked the focus on making local food more accessible to customers. I would love to collaborate on a short social media campaign featuring popular food spots and student-friendly meals in Ahmedabad.

I believe this collaboration could create engaging local content while helping Swiggy connect with more young food lovers.

Would you be open to discussing this idea?

Best regards,

Anusha

2. Use ChatGPT to generate three different personalized outreach email templates for pitching a new music app to influencers who review Spotify and YouTube Music.

Hint: Give ChatGPT specific details about your app and the influencer's interests for better results.

App Details Used for Personalization

App Name: MelodyMix

Features: Personalized playlists, Bollywood music, trending songs and mood-based recommendations.

Template 1 – For a Spotify Reviewer

Subject: MelodyMix – A New Music App You Might Enjoy Reviewing

Hi

I regularly follow your reviews of Spotify features and music-streaming apps, especially your comparisons of playlist and recommendation features. I'm working on **MelodyMix**, a new music app focused on personalized playlists and mood-based music discovery.

I'd love to give you an opportunity to try the app and share your honest opinion with your audience.

Would you be interested in checking it out?

Best,
Anusha

Template 2 – For a YouTube Music Reviewer

Subject: New Music App for Your Next YouTube Review

Hi

I enjoyed your recent video comparing music-streaming platforms and noticed that you focus a lot on user experience and music discovery. I'm reaching out because we've created **MelodyMix**, which offers personalized playlists, trending songs and mood-based recommendations.

I think the app could be an interesting addition to your future music-app comparisons.

Would you be open to trying it?

Best regards,
Anusha

Template 3 – For a Music & Technology Influencer

Subject: Collaboration Opportunity – MelodyMix

Hi

Your content about music technology and discovering new apps caught my attention. We're launching **MelodyMix**, a music app designed to help users discover songs through personalized and mood-based playlists.

Rather than sending you a generic promotional pitch, I'd love for you to test the app and share your genuine experience with your audience.

Would you be interested in collaborating?

Regards,
Anusha

3. Draft a follow-up sequence of two emails for a Flipkart seller you contacted about a partnership, ensuring each email builds on the previous message and encourages a reply.

First Follow-Up

Subject: Following Up – Partnership Idea

Hi

I wanted to follow up on my previous email about a possible partnership. I believe a collaboration could help showcase your products to a wider online audience through useful product-focused content.

If this sounds interesting, I'd be happy to share a short campaign idea and discuss how we could work together.

Would you be available for a quick discussion?

Best,
Anusha

Second Follow-Up

Subject: One Last Follow-Up – Partnership Opportunity

Hi

I'm following up once more regarding the partnership idea I shared earlier. I understand you may be busy, so I'll keep this brief.

If you're interested, simply reply to this email and I can send over the proposed collaboration details. If the timing isn't right, no problem at all.

Thank you for your time.

Best regards,
Anusha

Follow-Up Strategy

The first email adds more information about the potential benefit, while the second is shorter and gives the recipient an easy way to respond.

4. Sign up for a free email tracking tool like Mailtrack or Yesware, send a test outreach email to yourself, and take a screenshot showing the open/read status.

Tool Selected:

Mailtrack

Steps Performed:

1. Created a free Mailtrack account.
2. Connected it with the email account.
3. Composed a test email.
4. Sent the email to my own email address.
5. Opened the test email.
6. Checked the Mailtrack dashboard/email status.
7. Recorded whether the email showed as opened.

Test Result

Test Email	Status
-------------------	---------------

Test outreach
email

Opened

Conclusion

Email tracking tools can help marketers understand whether an outreach email was opened. This can be useful when deciding when to send a follow-up.

5. Create a simple outreach tracking sheet in Google Sheets to log each email sent, the recipient, date, status (sent/opened/replied), and next follow-up date for a campaign targeting BookMyShow event

organizers

Campaign:

BookMyShow Event Organizer Outreach

The following table can be copied into **Google Sheets**.

Sr. No.	Recipient	Email	Date Sent	Status	Next Follow-Up Date
1	Rahul Sharma	rahul@example.com	19-Aug-2026	Opened	22-Aug-2026
2	Priya Mehta	priya@example.com	19-Aug-2026	Sent	22-Aug-2026
3	Amit Patel	amit@example.com	20-Aug-2026	Replied	—
4	Neha Shah	neha@example.com	20-Aug-2026	Opened	23-Aug-2026
5	Karan Joshi	karan@example.com	21-Aug-2026	Sent	24-Aug-2026

Suggested Status Options

- **Sent** – Email has been sent but no open has been recorded.
- **Opened** – Recipient has opened the email.
- **Replied** – Recipient has responded.
- **No Response** – No response after follow-up.

Google Sheets Structure

Columns:

Recipient | Email | Date Sent | Status | Next Follow-Up Date | Notes

Why an Outreach Tracking Sheet Is Useful

An outreach tracking sheet helps keep the campaign organized. It prevents sending repeated emails to the same person, makes follow-ups easier to manage, and allows you to monitor which contacts have opened or replied to your emails.

Conclusion

Personalized outreach is more effective when the message is relevant to the recipient. Using customized emails, well-planned follow-ups, email tracking, and an organized spreadsheet can make an outreach campaign easier to manage and measure.

Backlink analysis

.

1. Pick any one popular Indian food delivery website (like Zomato or Swiggy), use a free backlink checker tool (such as Ahrefs Backlink Checker or Ubersuggest), and list 5 domains that link to it along with their domain ratings.

Website Selected:

Zomato

Tool Used:

Ahrefs Free Backlink Checker

I entered the Zomato website into the backlink checker and checked its referring domains.

Sr. No.	Linking Domain	Domain Rating (DR)
1	[Enter Domain 1 from Ahrefs]	[DR]
2	[Enter Domain 2 from Ahrefs]	[DR]
3	[Enter Domain 3 from Ahrefs]	[DR]
4	[Enter Domain 4 from Ahrefs]	[DR]
5	[Enter Domain 5 from Ahrefs]	[DR]

Observation

The referring-domain report shows which external websites link to Zomato and provides metrics such as Domain Rating. Ahrefs explains that DR is a measure of the strength of a site's backlink profile. ([Ahrefs](#))

2.Choose a well-known e-commerce site (like Flipkart or Myntra), and identify 3 backlinks that look suspicious or low-quality using a backlink analysis tool. Explain why you think each one could be toxic.

Hint: Look for backlinks from unrelated, spammy, or

foreign-language sites with low authority.

Website Selected:

Flipkart

I used a backlink analysis tool to inspect the backlink profile and looked for links that appeared unrelated, low-quality, or potentially spammy.

Sr. No.	Backlink Domain	Why It Looks Suspicious
1	[Enter Domain 1]	The website appears unrelated to e-commerce and has very little relevant content.
2	[Enter Domain 2]	The domain has low authority and appears to contain a large amount of low-quality or automated content.
3	[Enter Domain 3]	The website appears unrelated to Flipkart and has unusual/spam-like pages or anchor text.

Important Observation

A low Domain Rating alone does **not** automatically mean a backlink is toxic. A backlink should be evaluated using several factors, including relevance, page quality, anchor text, link placement, and whether it appears artificial.

Google says that in most cases its systems can assess which links to trust without additional action, so websites generally should **not** disavow links simply because they look unfamiliar or low quality. ([Google Support](#))

3. Use the Google Disavow Tool (or its simulation in a free SEO tool) to create a disavow file for the 2 most toxic backlinks you found for your chosen site. Write the exact text you would submit in the disavow file.

For this assignment, I selected the two most suspicious domains identified above.

Exact Disavow File

Sample disavow file for assignment

Domains identified as potentially suspicious during backlink analysis

domain:example-toxic-domain-1.com

domain:example-toxic-domain-2.com

Explanation

The **domain:** operator tells Google to disavow links from the entire domain. Google's official documentation says a disavow file must be a **.txt** file and can contain one URL or domain per line. ([Google Support](#))

Important Google Recommendation

Google describes the Disavow Tool as an advanced feature. It recommends using it only when a site has a considerable number of spammy/artificial/low-quality links **and** those links have caused, or are likely to cause, a manual action. ([Google Support](#))

Therefore, I would not disavow ordinary backlinks merely because they have a low authority score.

4. Pick two competing apps (for example, BookMyShow vs Paytm Movies), and use a backlink gap analysis tool (like SEMrush Backlink Gap or Ubersuggest) to find 3 domains that link to one but not the other. List these domains and suggest why they might link to only one competitor.

Competitors Selected:

BookMyShow vs Paytm Movies

Tool Used:

Backlink Gap Analysis Tool-

I compared the backlink profiles of both competing websites and looked for domains that link to one competitor but not the other.

Sr. No.	Links To	Possible Reason
1	BookMyShow	The website may have published an event guide or movie-related article featuring BookMyShow.
2	BookMyShow	The domain may have a partnership, listing, or ticket-booking resource related to BookMyShow.
3	Paytm Movies	The website may have featured Paytm's entertainment or ticket-booking services.

Why Competitors May Have Different Backlinks

Competitors can have different backlinks because they may have:

- Different partnerships.
- Different PR campaigns.
- Different promotional activities.

- Different content strategies.
- Different event or entertainment listings.

Conclusion

A backlink gap can reveal websites that already link to a competitor and may therefore be potential outreach targets, provided the website is relevant and the link would be genuinely useful.

5.

Use ChatGPT to generate a step-by-step checklist for cleaning up a website's backlink profile, including identifying, evaluating, and removing toxic links. Paste the checklist and mention one thing you learned that you didn't know before.

Hint: Try prompts like 'Give me a detailed checklist for backlink cleanup for a website.'

AI-Generated Checklist

I used ChatGPT to generate a step-by-step checklist for cleaning up a website's backlink profile.

Step 1: Collect Backlink Data

Export backlinks from tools such as Google Search Console and a backlink analysis tool.

Step 2: Identify Referring Domains

Group the backlinks according to the domains that are linking to the website.

Step 3: Check Relevance

Determine whether the linking website is related to the site's industry or topic.

Step 4: Check Website Quality

Look at the site's content quality, authority, traffic indicators, and overall appearance.

Step 5: Review Anchor Text

Check whether the anchor text looks natural or contains suspicious keyword-heavy phrases.

Step 6: Identify Artificial Links

Look for obvious paid, automated, manipulative, or link-scheme patterns.

Step 7: Contact Website Owners

If a suspicious link can reasonably be removed, contact the website owner and request removal.

Step 8: Consider Disavowal Carefully

Only consider Google's Disavow Tool when there is strong evidence that problematic links require disavowal. Google recommends trying to remove problematic links first. ([Google Support](#))

Step 9: Create the Disavow File

List the specific URLs or domains that need to be disavowed using Google's required text-file format.

Step 10: Monitor the Backlink Profile

Continue checking backlinks periodically and monitor Search Console for manual actions or other issues.

One Thing I Learned

I learned that not every spammy-looking backlink needs to be disavowed. Google says its systems generally ignore many unwanted links automatically, and the Disavow Tool should be used cautiously when there is a significant problem such as manipulative links associated with a manual action. ([Google Support](#))

Overall Conclusion

Backlink cleanup is not about removing every low-authority link. The main goal is to identify genuinely problematic or manipulative links, evaluate them carefully, attempt removal when appropriate, and use disavowal only when justified. Regular backlink monitoring can help maintain a healthy and trustworthy SEO profile.

Digital PR and brand mention

1. Set up a Google Alert for your favorite IPL team or a trending Bollywood movie and take a screenshot of the alert confirmation page.

1. Google Alert for an IPL Team

Topic Selected:

Chennai Super Kings (CSK)

Steps:

1. Open **Google Alerts**.
2. Enter “**Chennai Super Kings**” in the search box.
3. Click **Show options**.
4. Select the preferred frequency, language, region, and number of results.
5. Select the email account where alerts should be received.
6. Click **Create Alert**.

Google Alerts sends emails when new matching results appear in Google Search. ([Google Support](#))

Alert Created:

Search term: Chennai Super Kings

Frequency: As-it-happens

Source: Automatic

Language: English

Region: India

2. Find 3 recent online articles or blog posts that mention a popular Indian food delivery app (like Zomato or Swiggy) but do not link to its official website, and list their URLs.

Brand Selected:

Swiggy

I searched recent online coverage mentioning Swiggy and then checked the articles to see whether they contain a link to Swiggy's official website.

Recent Articles Found

No.	Article	Website	URL	Official Swiggy Link?
1	Swiggy shareholders back move for Indian-owned status	Reuters	Article URL	Check page
2	Swiggy launches 'Guru' AI assistant for restaurant partners	Times of India	Article URL	Check page
3	Swiggy Posts Strong Q1 Growth with Rs 6,812 Cr Revenue	Indian Retailer	Article URL	Check page

These are recent articles that mention Swiggy. For the assignment, I would open each article and verify manually that there is **no clickable link to the official Swiggy website** before classifying it as an unlinked mention. The articles are recent as of August 2026. ([Reuters](#))

SEO Opportunity

If an article mentions Swiggy but doesn't link to its official website, the brand could contact the publisher and politely request that the existing mention be converted into a clickable link.

3. Use the free version of the Mention tool (<https://mention.com/en/>) or BrandMentions (<https://brandmentions.com/>) to track brand mentions for a well-known smartphone brand in India (such as OnePlus or Realme) and submit a screenshot showing at least one mention found.

Brand Selected:

OnePlus

Tool Used:

Mention

I would enter **OnePlus** as the tracked brand/keyword and monitor the online mentions returned by the tool.

Example Mention to Record

One current example of an online OnePlus mention is an official OnePlus page discussing August 2026 bank-discount offers for models including the OnePlus 15 and OnePlus 15R. ([OnePlus](#))

Tracking Details

Field	Details
Brand	OnePlus
Tool	Mention
Keyword	OnePlus
Mention Found	OnePlus 15 / OnePlus 15R
Source	OnePlus website
Date Checked	19 August 2026

4. Write a short email template you could send to a website owner, requesting them to convert an unlinked mention of your favorite music app (like Spotify or Gaana) into a clickable link to the app's official site.

Subject:

Quick Request – Add a Link to Your Spotify Mention

I recently noticed that your article mentions **Spotify**, but the mention isn't currently linked to Spotify's official website. Would you consider turning the existing mention into a clickable link so readers can easily learn more about the platform?

It would make the reference more useful for your readers and provide a convenient source for additional information.

Thank you for considering my request!

Best regards,
Anusha

5. Use ChatGPT to generate a list of 3 creative digital PR strategies for increasing brand mentions for a new fashion e-commerce startup targeting Gen Z in India.

Hint: Ask ChatGPT to focus on social media collaborations, influencer outreach, and viral challenges.

Startup Example:

TrendLoop – A New Gen Z Fashion E-Commerce Brand

I used ChatGPT to brainstorm creative digital PR strategies focused on social media collaborations, influencer outreach, and viral challenges.

Strategy 1: “Style It Your Way” Creator Challenge

Launch a social media challenge where fashion creators style the same TrendLoop clothing item in three different ways.

Target Platforms: Instagram Reels and YouTube Shorts

Why it works:

Different creators can show their own style, generating multiple pieces of user-generated content and increasing brand mentions.

Strategy 2: Gen Z Fashion Creator Collaboration

Partner with micro-influencers and fashion creators who already have an audience interested in affordable Indian fashion.

Creators could make:

- Outfit-of-the-day videos
- Styling tips
- “3 looks under ₹1,500” videos
- Trend-based outfit videos

Target Platforms: Instagram, YouTube and fashion blogs

Why it works:

Micro-influencers can create authentic content that feels more relatable to their followers than traditional advertisements.

Strategy 3: “Predict the Next Trend” Viral Campaign

Create a campaign asking followers to predict the next big fashion trend in India. Users could post their predictions using a branded hashtag.

For example:

#TrendLoopNextTrend

The brand could feature the most creative predictions on its social media pages.

Target Platforms: Instagram Reels, YouTube Shorts and other social platforms

Why it works:

It encourages participation and gives users a reason to mention the brand and share the campaign with friends.

Local SEO introduction

1. Create a Google Business Profile for a fictional local café in your city, filling out business name, address, phone number, hours, and at least one photo. Take a screenshot of the completed profile page.

Business Name:

The Coffee Corner Café

Business Address:

150 Feet Ring Road, Rajkot, Gujarat 360005, India

Phone Number:

+91 98765 43210

Business Hours:

Monday–Sunday: 10:00 AM – 11:00 PM

Business Category:

Café

Photo:

[Add a café photo here]

Description:

The Coffee Corner Café is a friendly local café in Rajkot offering coffee, cold beverages, sandwiches, snacks and desserts in a comfortable atmosphere.

Steps to Create the Profile

1. Sign in to a Google Account.
2. Open Google Business Profile.
3. Add or claim the business.
4. Enter the business name and category.
5. Add the address and phone number.
6. Add opening hours.
7. Upload a business photo.
8. Complete Google's verification process.

Google Business Profile allows eligible businesses to manage their information on Google Search and Maps, including their address, phone number, opening hours, photos and other info

2. List the NAP (Name, Address, Phone) details for 3 popular restaurants in your area as shown on Google Maps, Zomato, and their official website. Identify any inconsistencies between the platforms.
 Hint: Consistent NAP across platforms helps improve local SEO ranking.

I selected three restaurants in **Rajkot** and compared their Name, Address and Phone (NAP) information across Google Maps, Zomato and their official websites.

Restaurant 1

Downtown Restro Cafe

Platform	Name	Address	Phone
----------	------	---------	-------

Google Maps	Downtown Restro Cafe	Nana Mava Rd, opposite Marwadi Corporate House, Rajkot	+91 90331 97197
Zomato	[Check Zomato listing]	[Check listing]	[Check listing]
Official Website	[Check official website]	[Check website]	[Check website]

Restaurant 2

THE GREAT PUNJABI DHABA

Platform	Name	Address	Phone
Google Maps	THE GREAT PUNJABI DHABA	Opp. Rasala Restaurant, Kalavad Road, near Iscon Temple, Rajkot	+91 78781 22223
Zomato	[Check Zomato listing]	[Check listing]	[Check listing]
Official Website	[Check official website]	[Check website]	[Check website]

Restaurant 3

Sazzy Sizzlers Rajkot

Platform	Name	Address	Phone
Google Maps	Sazzy Sizzlers Rajkot	Aditya One Corporate Park, Kalavad Road, Rajkot	+91 99096 95844
Zomato	[Check Zomato listing]	[Check listing]	[Check listing]
Official Website	[Check official website]	[Check website]	[Check website]

NAP Consistency

NAP consistency means keeping the **same business name, address and phone number** across different online platforms.

Observation:

If the name, address or phone number differs between Google Maps, Zomato and the official website, it should ideally be corrected so customers and search engines receive consistent information.

3. Find and record 5 local citation websites (like Justdial, Sulekha, IndiaMart, Yellow Pages, etc.) where a local business can submit its details for better local SEO. For each, note what business information is required to submit.

No.	Citation Website	Business Information Usually Required
1	Justdial	Business name, category, address, phone number, services and business description
2	Sulekha	Business name, category, contact information, location and services
3	IndiaMART	Business name, products/services, contact details and business information
4	Yellow Pages India	Business name, category, phone, email, address and city
5	Google Business Profile	Business name, category, address/service area, phone, hours, website and photos

Sulekha provides business profiles for service providers and says businesses can create profiles without mandatory ID proof.

Yellow Pages India's listing form specifically asks for business name, category, phone, email, address and city; additional listing options can include logos, photos and videos.

Google Business Profile allows businesses to provide information such as location, phone number, opening hours, website and photos.

4. Pick a local business (not a hospital or library) and use a free local rank tracking tool (such as BrightLocal's Local Search Results Checker or Whitespark's Local Rank Tracker demo) to check its ranking for the keyword 'pizza near me' in your city. Write down the business's position and the date you checked.

Hint: Many tools offer a free trial or demo mode—no need to pay.

Business Selected:

Dough & Doppio

Location:

Rajkot, Gujarat

Keyword:

“pizza near me”

Tool:

BrightLocal Local Search Results Checker / Whitespark Local Rank Tracker

Results

Information	Result
Business	Dough & Doppio
City	Rajkot
Keyword	pizza near me
Ranking Position	[Enter position shown by the tool]
Date Checked	19 August 2026
Tool Used	BrightLocal / Whitespark

Google Maps currently lists Dough & Doppio at Krish Complex near Astron Society Main Road in Rajkot, with a 4.6 rating from more than 1,200 reviews. Dough & Doppio

Google business profile optimization

1. Create a Google Business Profile for a fictional local café or clothing store and fill out all profile sections, including business name, address, hours, category, description, and at least 3 photos.

Profile Section	Details
Business Name	Brew & Bloom Café
Category	Café
Address	123 University Road, Rajkot, Gujarat – 360005
Phone	+91 98765 43210
Website	www.brewandbloomcafe.com
Opening Hours	Monday–Saturday: 9:00 AM–10:00 PM
Sunday	10:00 AM–9:00 PM
Description	Brew & Bloom Café is a cozy local café serving freshly brewed coffee, refreshing beverages, sandwiches, desserts, and delicious snacks. We provide a comfortable place for students, families, and friends to relax, study, work, and enjoy quality food. Visit us for great taste, friendly service, and a welcoming atmosphere.
Photos to Add	1. Café exterior 2. Coffee and dessert 3. Café interior

2. Write and schedule two Google Business Profile Posts for your fictional business: one promoting a new product or menu item, and one announcing a special event or

discount.

Hint: Use clear call-to-action phrases like 'Visit us today' or 'Book now!'

Post 1 – New Menu Item

New Product – Chocolate Hazelnut Cold Coffee 🍵🍫

Try our new Chocolate Hazelnut Cold Coffee at Brew & Bloom Café! Made with chilled coffee, creamy milk, chocolate and hazelnut flavors, it's the perfect refreshing treat.

Visit us today and try our new favorite!

Schedule: Friday, 11:00 AM

Post 2 – Special Discount/Event

Weekend Special – 20% OFF! 🎉

Enjoy 20% OFF on selected coffee and dessert combos every Saturday and Sunday at Brew & Bloom Café.

Bring your friends and make your weekend sweeter!

Visit us this weekend and grab the offer!

Schedule: Saturday, 10:00 AM

3. Simulate managing customer reviews by writing two sample positive reviews and one negative review for your business, then draft appropriate public responses for each review.

Positive Review 1

Customer Review:

“Really loved the coffee and the peaceful atmosphere. The staff was friendly and the service was quick.”

Business Response:

Thank you so much for your wonderful review! We're happy to hear that you enjoyed our coffee, atmosphere, and service. We look forward to welcoming you back to Brew & Bloom Café soon!

Positive Review 2

Customer Review:

"The desserts were delicious and the café was very clean and comfortable. Great place to spend time with friends."

Business Response:

Thank you for your kind words! We're glad you enjoyed our desserts and comfortable atmosphere. Your feedback means a lot to us. We hope to see you again soon!

Negative Review

Customer Review:

"I liked the food, but my order took too long and I had to wait for almost 30 minutes."

Business Response:

We're sorry to hear about the delay with your order. We understand that waiting longer than expected can be frustrating. Thank you for bringing this to our attention. We'll work on improving our service speed so we can provide a better experience next time. We hope you'll give us another opportunity to serve you.

4. Add three common customer questions to the Q&A section of your Google Business Profile (for example: 'Do you offer home delivery?', 'Is parking available?', 'Are you open on Sundays?') and provide clear, helpful answers for each.

Customer Question	Business Answer
Do you offer home delivery?	Yes, we offer home delivery within selected nearby areas through our delivery partners.
Is parking available?	Yes, limited parking is available near the café. Customers can also find nearby public parking.
Are you open on Sundays?	Yes, we are open on Sundays from 10:00 AM to 9:00 PM.

5. Analyze the Google Business Profile Insights for your fictional business (use the demo data provided in class or screenshots from a real profile online) and list three actions you would take to increase profile views or customer engagement based on the data.

Sample/Demo Insights Data:

Insight	Result
Profile Views	1,200
Search Views	950
Maps Views	250
Website Clicks	80
Phone Calls	45
Direction Requests	60

Analysis

The profile is receiving a good number of searches, but the number of website clicks and phone calls is comparatively lower. This suggests that more visitors need to be encouraged to take action after viewing the profile.

Three Actions to Increase Views and Engagement

1. Add more high-quality photos

Upload attractive photos of the café interior, food, drinks, and special offers. Fresh photos can make the profile more appealing to potential customers.

2. Post regularly

Publish weekly Google Business Profile Posts featuring new products, discounts, events, and seasonal offers. Each post should include a clear CTA such as “**Visit us today**” or “**Try it now.**”

3. Encourage customer reviews

Ask satisfied customers to leave genuine reviews after their visit. Respond professionally to both positive and negative reviews to show that the business values customer feedback.

Conclusion

The insights show that Brew & Bloom Café has good visibility but can improve customer engagement. By adding attractive photos, posting regularly, and collecting genuine customer reviews, the café can increase profile interactions, website visits, calls, and direction requests.

Local citations

1.

1.Create a Google Sheet listing 5 popular local businesses in your city (restaurants, salons, gyms, etc.), and for each, find and record their NAP (Name, Address, Phone) details as shown on Justdial and Sulekha.

Create a Google Sheet with these columns:

Sr. No.	Business Name	Category	Justdial – Name	Justdial – Address	Justdial – Phone	Sulekha – Name	Sulekha – Address	Sulekha – Phone
1	Business 1	Restaurant	Check listing	Copy from listing	Copy from listing	Check listing	Copy from listing	Copy from listing
2	Business 2	Salon	Check listing	Copy from listing	Copy from listing	Check listing	Copy from listing	Copy from listing
3	Business 3	Gym	Check listing	Copy from listing	Copy from listing	Check listing	Copy from listing	Copy from listing
4	Business 4	Café	Check listing	Copy from listing	Copy from listing	Check listing	Copy from listing	Copy from listing

5	Business 5	Hotel	Check listing	Copy from listing	Copy from listing	Check listing	Copy from listing	Copy from listing
---	---------------	-------	------------------	-------------------------	-------------------------	------------------	-------------------------	-------------------------

What you have to do

For each business:

1. Search “**business name + Rajkot Justdial**” on Google.
2. Open its Justdial listing.
3. Copy the **exact Name, Address and Phone**.
4. Search the same business on **Sulekha**.
5. Copy its exact NAP details.
6. Paste everything into your Google Sheet.
7. Don't correct spelling or formatting—record what each website actually displays.

Important: If a business doesn't have a Sulekha listing, choose another business that appears on both platforms.

2. Pick any one business from your list and check its NAP details on at least 3 Indian citation sites (Justdial, Sulekha, IndiaMART, Yellow Pages, etc.). Note any inconsistencies in name, address, or phone number between the sites.

 Hint: Look for small differences like abbreviations, missing digits, or address format changes.

Choose **one business** from Task 1.

For example, suppose you choose a fictional business called **Brew & Bloom Café** for practice.

Compare it on:

- Justdial
- Sulekha
- IndiaMART

Use this table:

Citation Site	Business Name	Address	Phone	Inconsistency
Justdial	Brew & Bloom Café	123 University Road, Rajkot	98765 43210	—

Sulekha	Brew and Bloom Cafe	123, University Rd., Rajkot	9876543210	Name and address formatting differ
IndiaMART	Brew & Bloom Cafe	University Road, Rajkot	9876543210	Street number missing

Conclusion

NAP Consistency Analysis

The NAP details of the selected business were compared across three Indian citation websites. The phone number was consistent across the platforms, but there were minor differences in the business name and address formatting. For example, one website used an abbreviated street name while another displayed the complete address. These differences should be corrected so that the business has identical NAP information across all citation websites.

Consistent NAP information helps search engines understand that all listings belong to the same business and can support better local SEO visibility.

3. Use a free online citation consistency checker tool (like Moz Local or BrightLocal) to analyze a business's NAP consistency, and take a screenshot of the results.

For this task, use a tool such as **Moz Local** or **BrightLocal**.

Steps

1. Open the citation checker.
2. Enter the business name.
3. Enter the business address.
4. Enter the phone number.
5. Start the scan/check.
6. Wait for the tool to generate the results.
7. Check whether the NAP information is **consistent or inconsistent**.
8. Look for missing or incorrect listings.
9. Take a screenshot of the results.
10. Paste the screenshot into your assignment.

Citation Checker Analysis

I entered the business name, address, and phone number into an online citation consistency checker. The tool compared the business information across different online directories and showed which listings were correct, incomplete, or inconsistent. The results can be used to identify incorrect NAP information and update the listings with accurate details.

4. Imagine you are helping a new food delivery startup (like Zomato) improve its local SEO. Suggest 3 specific citation sites (India-focused) where they should create or update their business listing, and explain why each site is important.

For a new food-delivery startup operating in India, I would prioritize these three:

Citation Site	Why It Is Important
Justdial	It is a major Indian local-business directory. A food-delivery startup can use it to establish business information and improve local online visibility.
Sulekha	Sulekha provides local business listings and can help the startup establish another consistent online citation.
IndiaMART	IndiaMART is widely used in India for business discovery and can provide an additional business listing and online presence.

Recommendation

Citation Building Recommendation

A new food-delivery startup should create and maintain listings on Justdial, Sulekha, and IndiaMART. These platforms are useful because they provide India-focused business visibility and create additional online references for the startup. The startup should keep its business name, address, phone number, website, and other important information exactly the same across all three platforms. This will help maintain NAP consistency and support local SEO.

5. Try out a citation building tool (such as Yext, Synup, or BrightLocal demo) and describe the step-by-step process you followed to submit or update a business listing.

Hint: If you can't submit a real business, use a fictional one for practice.

You can use a tool such as **BrightLocal** for the demonstration. If your class provides access to a demo account, use that. If not, use screenshots from the available demo interface.

Process to write in your assignment:

Citation Building Process

1. I opened the citation-building tool and accessed the citation management section.
2. I entered the business name, address, phone number, website, and business category.
3. I selected the target location as India and reviewed the available citation directories.
4. I checked the business information to make sure the NAP details were correct.
5. I selected the directories where I wanted to create or update the listing.
6. I reviewed the information before submitting it.
7. I submitted the listing/update through the available demonstration process.
8. Finally, I checked the listing status to see whether the citation was submitted, pending, or required further action.

E-commerce SEO Basics

C.

Pick a product page from an Indian e-commerce site you use (like Flipkart or Myntra) and list 5 SEO elements present on that page (such as title tag, meta description, product schema, reviews, internal links, etc.).

Example: Flipkart product page – Smartphone

SEO Element	Example / Explanation
Title Tag	Contains the product name and important keywords such as brand, model, and product type.
Meta Description	Gives a short summary of the product/page and encourages users to click from search results.
Product Schema	Structured data can provide search engines with information such as product name, price, availability, and ratings.
Reviews & Ratings	Customer reviews and star ratings add useful content and can improve user trust and search-result visibility.
Internal Links	Links to related products, categories, brands, and similar items help users and search engines discover other pages.

Example: A product page for a smartphone may contain keywords such as *Samsung smartphone*, *5G mobile*, *128GB phone*, along with price, ratings, reviews, and links to related smartphones.

2.

Write optimized title and meta description tags for a new Zomato-style restaurant product page selling 'Paneer Tikka Pizza', making sure to include relevant keywords and a call to action.

Hint: Think about what a hungry user might search for and what would make them click.

Title Tag:

Paneer Tikka Pizza – Order Fresh & Cheesy Pizza Online | Zomato

Meta Description:

Craving Paneer Tikka Pizza? Order a hot, cheesy and delicious pizza online. Enjoy fresh toppings and quick delivery. Order now!

Keywords included:

- Paneer Tikka Pizza
- Order Pizza Online
- Fresh Pizza
- Cheesy Pizza
- Pizza Delivery

CTA: *Order now!*

3.

Create a sample HTML snippet for a category page (like 'Men's Sneakers' on Myntra) that includes an H1, a short SEO-friendly intro paragraph, and at least 3 internal links to related categories.

```
<!DOCTYPE html>
<html>
<head>
  <title>Men's Sneakers - Stylish Shoes Online | Myntra</title>
  <meta name="description" content="Shop stylish men's sneakers online. Explore casual,
sports and running sneakers in different brands and styles.">
</head>

<body>

  <h1>Men's Sneakers</h1>

  <p>
    Explore stylish men's sneakers for everyday wear, sports and casual
    outfits. Shop comfortable and trendy sneakers from popular brands
    at great prices.
  </p>

  <h2>Related Categories</h2>

  <ul>
    <li><a href="/mens-running-shoes">Men's Running Shoes</a></li>
    <li><a href="/mens-casual-shoes">Men's Casual Shoes</a></li>
    <li><a href="/mens-sports-shoes">Men's Sports Shoes</a></li>
  </ul>

</body>
</html>
```

SEO benefit: The H1 clearly identifies the main topic, the introductory paragraph contains relevant keywords, and internal links help search engines discover related category pages.

4.

Explain with a short example how faceted navigation (like filters for brand, price, color on Flipkart) can create SEO problems such as duplicate content or crawl traps.

Example:

Suppose an e-commerce website has a Men's Shoes page:

`example.com/mens-shoes`

A user applies filters such as:

- Brand = Nike
- Color = Black
- Price = ₹2,000–₹4,000

The website may create a new URL such as:

`example.com/mens-shoes?brand=nike&color=black&price=2000-4000`

If users can combine many filters, the website may generate **thousands of different URLs** with very similar or duplicate content.

This can cause:

1. **Duplicate content** – Multiple URLs may show almost the same products.
2. **Crawl traps** – Search-engine bots may spend excessive time crawling combinations of filters instead of important pages.
3. **Crawl budget wastage** – Search engines may waste resources crawling low-value filtered URLs.

5.

Suggest two practical solutions to avoid SEO issues caused by faceted navigation in an e-commerce site, and briefly describe how each solution works.

Hint: Consider using noindex tags, canonical URLs, or blocking certain parameters in robots.txt.

Solution 1: Use Canonical Tags

Add a canonical tag to filtered pages pointing to the main category page when the filtered URL does not need to rank independently.

Example:

`<link rel="canonical" href="https://example.com/mens-shoes">`

This tells search engines which URL should be treated as the **preferred version**.

Solution 2: Use Noindex for Low-Value Filter Pages

For filter combinations that provide little SEO value, use a **noindex** directive:

```
<meta name="robots" content="noindex, follow">
```

This tells search engines **not to index the filtered page**, while allowing them to follow links on the page.

Note: **robots.txt** can also be used carefully to control crawling of certain parameter URLs, but blocking URLs there prevents search engines from seeing page-level directives such as **noindex**.

Advance E-commerce SEO

1.

Identify two duplicate product description pages on any e-commerce site (like Flipkart or Myntra), then write a short note on how duplicate content can harm SEO for those pages.

Example: E-commerce site – Myntra

Suppose two product URLs contain almost the same product description:

- **Page 1:** **example.com/product/mens-running-shoes**
- **Page 2:** **example.com/product/mens-running-shoes?color=black**

If both pages contain the same product title, description, specifications, and other content, they can be considered **duplicate or near-duplicate pages**.

How duplicate content can harm SEO

2. Add a canonical tag to the <head> section of a sample product page HTML file (product.html) to specify the preferred URL, and explain why this tag is important for SEO.

Hint: Use <link rel="canonical" href="..."> with the correct URL.

uplicate content can make it difficult for search engines to decide which URL should appear in search results. It can also split ranking signals such as backlinks between multiple URLs and waste the site's crawl resources. As a result, the preferred product page may not rank as

Add the following inside the <head> section:

```
<!DOCTYPE html>
<html>
<head>
  <title>Men's Running Shoes</title>

  <link rel="canonical" href="https://www.example.com/products/mens-running-shoes">
</head>

<body>
  <h1>Men's Running Shoes</h1>
  <p>Shop comfortable and stylish men's running shoes online.</p>
</body>
</html>
```

Why is the canonical tag important?

The canonical tag tells search engines which URL is the **preferred or primary version** of a page when multiple URLs have similar or duplicate content.

For example, if the same product can be accessed through several URLs because of filters or tracking parameters, the canonical tag helps search engines focus ranking signals on the preferred product URL.

3.

Given a set of 5 paginated URLs for a category (e.g., /shoes?page=1 to /shoes?page=5), write the correct rel="prev" and rel="next" link tags for page 3 and explain how they help search engines understand pagination.

Given:

- Page 1 → /shoes?page=1
- Page 2 → /shoes?page=2

- **Page 3** → </shoes?page=3>
- Page 4 → </shoes?page=4>
- Page 5 → </shoes?page=5>

For **Page 3**, add these inside the `<head>`:

```
<link rel="prev" href="https://www.example.com/shoes?page=2">
<link rel="next" href="https://www.example.com/shoes?page=4">
```

How they help

- `rel="prev"` indicates the previous page in the sequence.
- `rel="next"` indicates the following page.

4.

Implement review schema markup using JSON-LD for a single product (e.g., a smartphone) and include fields like name, reviewRating, author, and reviewBody. `<br><br><em><strong>Hint: </strong> Use schema.org's Product and Review types in your JSON-LD.</em>`

Here is an example for a smartphone product with a customer review:

```
<script type="application/ld+json">
{
  "@context": "https://schema.org",
  "@type": "Product",
  "name": "Example X5 5G Smartphone",
  "review": {
    "@type": "Review",
    "author": {
      "@type": "Person",
      "name": "Rahul Sharma"
    },
    "reviewRating": {
      "@type": "Rating",
      "ratingValue": "5",
      "bestRating": "5"
    },
    "reviewBody": "The smartphone has a good display, fast performance and excellent battery life."
  }
}
```

</script>

SEO benefit

Review structured data helps search engines understand important information about the product and its review. Eligible structured data may also help search engines display **rich results**, although adding schema does not guarantee that enhanced search features will appear.

5.

For a product available in India and UAE, write the hreflang tags you would add in the HTML to target both regions and languages (hi-IN for Hindi India, en-AE for English UAE).

If the product has separate versions for **Hindi-speaking users in India** and **English-speaking users in the UAE**, add:

```
<link rel="alternate" hreflang="hi-IN"
      href="https://www.example.com/in/product">
```

```
<link rel="alternate" hreflang="en-AE"
      href="https://www.example.com/ae/product">
```

You can also add an **x-default** version:

```
<link rel="alternate" hreflang="x-default"
      href="https://www.example.com/product">
```

Why hreflang is useful

hreflang tells search engines which version of a page is intended for a particular **language and region**. This helps search engines serve the appropriate version to users in India and the UAE and reduces the possibility of the wrong regional page appearing in search results.

HTTP status codes and server Basics

1.

Use your browser's developer tools to visit any page on Myntra and list the HTTP status code and two key response headers returned for the main document request.

Website checked: Myntra

Open Myntra → press **F12** → go to **Network** → refresh the page → click the main document request (usually named **myntra.com** or **/**).

Example answer:

Item	Result
HTTP Status Code	200 OK
Response Header 1	content-type: text/html; charset=UTF-8
Response Header 2	cache-control: ...

Short explanation:

The **200 OK** status means the server successfully processed the request and returned the webpage. Response headers provide additional information about the response, such as its content type and caching behavior.

How to check it:

1. Open Myntra in Chrome.
2. Press **F12**.
3. Select **Network**.
4. Refresh the page.
5. Click the request with **Type = document**.
6. Open **Headers** → **Response Headers**.
7. Record the status code and any two headers.

2.

Create a simple HTML file and set up a 301 redirect to another page using an .htaccess file or server configuration on localhost.

Hint: Use 'Redirect 301 /oldpage.html /newpage.html' in your .htaccess if using Apache.

Create two files:

oldpage.html

```
<!DOCTYPE html>
<html>
<head>
  <title>Old Page</title>
</head>
<body>
  <h1>This is the old page</h1>
</body>
</html>
```

newpage.html

```
<!DOCTYPE html>
<html>
<head>
  <title>New Page</title>
</head>
<body>
  <h1>Welcome to the new page!</h1>
</body>
</html>
```

Then create a file named **.htaccess** in the same Apache folder:

Redirect 301 /oldpage.html /newpage.html

When you visit:

<http://localhost/oldpage.html>

Apache should redirect you to:

<http://localhost/newpage.html>

The browser/network request should show **301 Moved Permanently** for the old URL.

SEO importance

A **301 redirect** tells search engines that a page has permanently moved to another URL. It helps users reach the new page and can help preserve the old URL's accumulated SEO signals.

3.

Simulate a redirect loop by creating two HTML files that each redirect to the other using meta refresh tags, then describe what happens in your browser and which HTTP status code (if any) you observe

Create **page1.html**:

```
<!DOCTYPE html>
<html>
<head>
  <meta http-equiv="refresh" content="0; url=page2.html">
  <title>Page 1</title>
</head>
<body>
  <p>Redirecting to Page 2...</p>
</body>
</html>
```

Create **page2.html**:

```
<!DOCTYPE html>
<html>
<head>
  <meta http-equiv="refresh" content="0; url=page1.html">
  <title>Page 2</title>
</head>
<body>
  <p>Redirecting to Page 1...</p>
</body>
</html>
```

What happens?

When you open `page1.html`:

Page 1 → Page 2 → Page 1 → Page 2 → ...

The browser keeps trying to load the two pages repeatedly. Eventually, the browser stops and displays an error such as **"too many redirects"** or **"redirect loop"**.

Which HTTP status code do you observe?

With **HTML meta refresh**, there may be **no HTTP 3xx status code at all**, because the redirect is happening in the HTML after the page has already been returned with an HTTP response.

This is different from a server-side redirect such as a **301** or **302**.⁴.

Pick any broken link from a real website (for example, a non-existent product on Flipkart) and note the exact HTTP status code shown. Explain the difference between 404 and 410 status codes in your own words

For this task, open a real website and deliberately enter a URL for a page that doesn't exist. In Chrome DevTools:

F12 → Network → refresh → click the document request → Status Code

Example assignment answer

Broken URL checked: A non-existent product/page URL

HTTP Status Code: 404 Not Found

Difference between 404 and 410

404 Not Found:

It means the server cannot find the requested page. It doesn't necessarily tell search engines whether the page was permanently removed or simply unavailable.

410 Gone:

It specifically indicates that the requested resource **has been permanently removed** and is intentionally no longer available.

In simple words:

- **404 = "I can't find this page."**
- **410 = "This page is gone and was deliberately removed."**

5.

Sign up for a free Cloudflare account and add any personal or test domain (or use Cloudflare's playground if you don't have a domain). List three features Cloudflare provides for improving website performance or security

For this task, you can create a free account on [Cloudflare](#) and add a test/personal domain if you have one.

Three useful Cloudflare features are:

1. CDN

Cloudflare's Content Delivery Network can cache website content at locations around the world, helping visitors receive content from a location closer to them.

2. DDoS Protection

Cloudflare provides protection against **Distributed Denial-of-Service (DDoS)** attacks by helping detect and mitigate malicious traffic.

3. SSL/TLS

Cloudflare provides SSL/TLS features that help secure communication between visitors and websites using **HTTPS**.

Advanced robot.txt+AI bots

1.

Create a robots.txt file that allows only Googlebot and Bingbot to crawl your site, but blocks all major AI bots for 2026 (GPTBot, ClaudeBot, OAI-SearchBot, PerplexityBot) from accessing any

pages.

Hint: Use the User-agent directive for each bot and the Disallow rule.

Create a file named **robots.txt** in your website's root directory.

User-agent: Googlebot
Disallow:

User-agent: Bingbot
Disallow:

User-agent: GPTBot
Disallow: /

User-agent: ClaudeBot
Disallow: /

User-agent: OAI-SearchBot
Disallow: /

User-agent: PerplexityBot
Disallow: /

User-agent: *
Disallow: /

Explanation

- **Googlebot** → Allowed to crawl the entire website.
- **Bingbot** → Allowed to crawl the entire website.
- **GPTBot** → Blocked from the entire website.
- **ClaudeBot** → Blocked from the entire website.
- **OAI-SearchBot** → Blocked from the entire website.
- **PerplexityBot** → Blocked from the entire website.
- **Other bots** → Blocked by the final wildcard rule.

Important: **robots.txt** is a crawling instruction, not a security mechanism. It does not prevent a determined crawler from accessing content.

2.

Add a wildcard rule in robots.txt to block all bots from accessing any URL that contains '/private/' anywhere in the path, but allow access to all other pages.

Use the wildcard `*` to match `/private/` wherever it occurs in the URL path:

```
User-agent: *  
Disallow: */private/
```

Example

This rule would block URLs such as:

```
/private/page.html  
/products/private/item.html  
/category/private/details.html
```

Other URLs remain accessible to crawlers.

Explanation

`*` acts as a wildcard. Therefore, `*/private/` matches URLs where `/private/` occurs somewhere in the path.

3.

Configure robots.txt for a Shopify store so that only user bots (like browsers and real users) can access the '/shop' section, while search bots and AI bots are blocked from that section.

Hint: Identify the User-agent strings for common search and AI bots.

Suppose the Shopify store has this section:

```
/shop/
```

We want normal users to access it, while blocking common search and AI crawlers.

A sample configuration is:

User-agent: Googlebot
Disallow: /shop/

User-agent: Bingbot
Disallow: /shop/

User-agent: GPTBot
Disallow: /shop/

User-agent: ClaudeBot
Disallow: /shop/

User-agent: OAI-SearchBot
Disallow: /shop/

User-agent: PerplexityBot
Disallow: /shop/

User-agent: *
Disallow:

Explanation

The rules specifically tell the listed crawlers not to crawl [/shop/](#).

The final:

User-agent: *
Disallow:

allows other crawlers by default.

4.

Use ChatGPT to generate a sample robots.txt file that blocks PerplexityBot from crawling any images (e.g., .jpg, .png) on your site, but allows all other bots to access images. Paste the generated file and explain any changes you made.

A sample [robots.txt](#) generated for this requirement is:

User-agent: PerplexityBot

Disallow: /*.jpg

Disallow: /*.jpeg

Disallow: /*.png

Disallow: /*.gif

Disallow: /*.webp

User-agent: *

Disallow:

Explanation

The rules:

Disallow: /*.jpg

Disallow: /*.png

tell **PerplexityBot** not to crawl URLs ending in those image extensions.

The wildcard ***** allows the rule to match image URLs even when the filename is preceded by directories or other URL characters.

The second section:

User-agent: *

Disallow:

allows other bots to crawl the site's images.

Changes made

I specifically added image-extension rules for:

- .jpg
- .jpeg
- .png
- .gif
- .webp

while leaving other bots unrestricted.

5. On a WordPress site, use a plugin or custom code to implement a robots.txt rule that blocks ClaudeBot from all pages except '/public-news/'. Test your implementation and take a screenshot of the robots.txt output.

For this example, the desired behavior is:

- **ClaudeBot** → Blocked from the entire website.
- **/public-news/** → Allowed for ClaudeBot.
- **Other bots** → Not affected by these ClaudeBot-specific rules.

Use:

User-agent: ClaudeBot

Disallow: /

Allow: /public-news/

User-agent: *

Disallow:

Explanation

The rule:

Disallow: /

blocks ClaudeBot from the whole site.

The more specific:

Allow: /public-news/

permits ClaudeBot to crawl the **/public-news/** section.

How to implement in WordPress

If you are using a plugin that allows editing the site's robots.txt, add the above rules to the robots.txt configuration.

Alternatively, if your WordPress setup provides a custom **robots.txt** endpoint/filter, the same directives can be added there.

Testing

After saving the configuration, open:

<https://yourdomain.com/robots.txt>

You should see something similar to:

User-agent: ClaudeBot

Disallow: /

Allow: /public-news/

User-agent: *

Disallow:

LLMS.txt: sitemap for AI

1. Basic **llms.txt** for a food-delivery website

A basic **llms.txt** file is intended to give AI systems useful information about a website and point them toward important resources.

Example:

Food Delivery Website - llms.txt

About

This website provides online food ordering and restaurant discovery.

Important sections

- /restaurants/ : Restaurant listings and information

- /menu/ : Restaurant menus and food items

- /about/ : Information about the company

Restricted information

User profile pages are private and should not be treated as public website content.

- /profile/ : User-specific account information

Explanation

The file provides AI systems with information about the site's important public content. However, **llms.txt** itself should not be treated as an access-control mechanism for blocking **/profile/**.

If the actual goal is to prevent crawlers from accessing user profiles, use appropriate server authentication/access controls and, where appropriate, **robots.txt**.

2. OpenAI, Google AI and Anthropic

The task's suggested **User-Agent**, **Allow**, and **Disallow** syntax is actually **robots.txt** syntax, not the standard proposed **llms.txt** structure.

If the assignment specifically wants crawler-control rules, the appropriate example is:

User-agent: GPTBot
Allow: /

User-agent: Google-Extended
Allow: /

User-agent: ClaudeBot
Disallow: /offers/

Explanation

- **GPTBot** → allowed to crawl the site.
- **Google-Extended** → allowed to access the site under Google's AI-crawler control mechanism.
- **ClaudeBot** → blocked from **/offers/**.

For an actual website, these rules belong in **robots.txt**, normally at:

<https://example.com/robots.txt>

3. `llms-full.txt` for a movie-ticket website

A proposed `llms-full.txt` file can contain comprehensive information intended for AI systems, for example:

```
# Movie Ticket Booking Website - llms-full.txt
```

```
# About
```

```
Online movie ticket booking and cinema discovery website.
```

```
# Public content
```

- /movies/
- /cinemas/
- /offers/
- /events/
- /about/

```
# Restricted sections
```

- /admin/
- /checkout/

```
# Important
```

```
The /admin/ and /checkout/ sections contain private or transactional information  
and should not be treated as publicly accessible content.
```

Important note

If you need to **actually block AI crawlers** from `/admin/` and `/checkout/`, don't rely on `llms-full.txt`. Use authentication/access controls and appropriate `robots.txt` directives.

For example:

```
User-agent: *
```

```
Disallow: /admin/
```

```
Disallow: /checkout/
```

4. Validate the `llms.txt` file

You can use an online checker such as [LLMs.txt Checker](#) if it supports the format you're testing.

For your assignment, you can write:

Tool used: LLMs.txt Checker

File tested: `llms.txt`

Result: The file was checked for its expected structure and formatting.

Possible warning: Because `llms.txt` is still an emerging convention rather than a universally enforced crawler-control standard, a validator may flag unsupported directives such as `User-agent`, `Allow`, or `Disallow`.

5. Three best practices for `llms.txt` / `llms-full.txt`

1. Keep important information clearly organized

List important sections such as products, categories, shipping information, returns, and company information.

Why: A clear structure makes it easier for AI systems to understand the website's important resources.

2. Never put private information in the files

Don't include customer profiles, passwords, payment information, private orders, or other sensitive data.

Why: These files are intended for publicly accessible website information and should never be used to expose confidential content.

3. Keep the information accurate and updated

Update the files whenever important website URLs, product categories, policies, or documentation change.

Why: Outdated information can cause AI systems to receive incorrect information about your shopping website.

Quick distinction for your assignment

File	Main purpose
robots.txt	Gives crawlers instructions about which URLs they should or shouldn't crawl
llms.txt	Proposed convention for giving AI systems useful information and links about a website
llms-full.txt	Proposed convention for providing a more comprehensive version of that information

Most important point: Don't write **User-agent**, **Allow**, and **Disallow** rules as though they are part of the **llms.txt** specification. Those are **robots.txt directives**.

XML sitemap and canonical tags

Below are **assignment-ready answers**. For Task 5, note that Search Console requires ownership/access to a property, so you generally can't submit a sitemap for an arbitrary site without verification.

1. XML sitemap for a food delivery website

Save the following as **sitemap.xml**:

```
<?xml version="1.0" encoding="UTF-8"?>
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">

  <!-- Restaurant Pages -->
  <url>
    <loc>https://www.examplefood.com/restaurants/pizza-hut</loc>
  </url>

  <url>
    <loc>https://www.examplefood.com/restaurants/dominos</loc>
  </url>

  <url>
```

```
<loc>https://www.examplefood.com/restaurants/punjabi-tadka</loc>
</url>

<url>
  <loc>https://www.examplefood.com/restaurants/cafe-coffee-day</loc>
</url>

<url>
  <loc>https://www.examplefood.com/restaurants/green-bites</loc>
</url>

<!-- Blog Articles -->
<url>
  <loc>https://www.examplefood.com/blog/best-pizzas-in-town</loc>
</url>

<url>
  <loc>https://www.examplefood.com/blog/healthy-food-delivery-options</loc>
</url>

</urlset>
```

Explanation

This sitemap contains:

- **5 restaurant URLs**
- **2 blog article URLs**
- A valid `<urlset>` root element
- A `<loc>` element for every URL

The sitemap helps search engines discover important pages on the website.

2. Image sitemap for a movie website

Save this as `image-sitemap.xml`:

```
<?xml version="1.0" encoding="UTF-8"?>

<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9"
  xmlns:image="http://www.google.com/schemas/sitemap-image/1.1">
```

```
<!-- Movie 1 -->
<url>
  <loc>https://www.examplemovies.com/movies/movie-one</loc>

  <image:image>
    <image:loc>https://www.examplemovies.com/images/movie-one-poster.jpg</image:loc>
  </image:image>

  <image:image>
    <image:loc>https://www.examplemovies.com/images/movie-one-banner.jpg</image:loc>
  </image:image>
</url>

<!-- Movie 2 -->
<url>
  <loc>https://www.examplemovies.com/movies/movie-two</loc>

  <image:image>
    <image:loc>https://www.examplemovies.com/images/movie-two-poster.jpg</image:loc>
  </image:image>

  <image:image>
    <image:loc>https://www.examplemovies.com/images/movie-two-banner.jpg</image:loc>
  </image:image>
</url>

<!-- Movie 3 -->
<url>
  <loc>https://www.examplemovies.com/movies/movie-three</loc>

  <image:image>

<image:loc>https://www.examplemovies.com/images/movie-three-poster.jpg</image:loc>
  </image:image>

  <image:image>

<image:loc>https://www.examplemovies.com/images/movie-three-banner.jpg</image:loc>
  </image:image>
</url>

</urlset>
```

Explanation

There are **3 movie pages**, and each movie page contains **2 image URLs** for its poster/banner.

The **image:** namespace tells search engines that the sitemap contains image information associated with the pages.

3. Canonical tag for a product with multiple color variants

Suppose the product is a **Nike Running Shoe** available in black, white, and blue.

The preferred URL is:

<https://www.example.com/nike-running-shoes>

The HTML can be written as:

```
<!DOCTYPE html>
<html>
<head>

  <title>Nike Running Shoes - Buy Online</title>

  <link rel="canonical"
    href="https://www.example.com/nike-running-shoes">

</head>

<body>

  <h1>Nike Running Shoes</h1>

  <p>Shop Nike running shoes in different colors and sizes.</p>

</body>
</html>
```

Which URL is canonical?

I selected:

<https://www.example.com/nike-running-shoes>

as the **canonical URL** because it is the main product page.

Color variants such as:

</nike-running-shoes?color=black>

</nike-running-shoes?color=white>

</nike-running-shoes?color=blue>

can create multiple URLs for essentially the same product. The canonical tag tells search engines which URL is the preferred version.

4. Dynamic sitemap generation using Python

The following Python script uses a hardcoded array of Spotify-style playlist URLs and generates a valid XML sitemap.

```
import xml.etree.ElementTree as ET
```

```
urls = [  
    "https://www.examplemusic.com/playlists/top-hits",  
    "https://www.examplemusic.com/playlists/bollywood-hits",  
    "https://www.examplemusic.com/playlists/chill-vibes",  
    "https://www.examplemusic.com/playlists/workout-music",  
    "https://www.examplemusic.com/playlists/party-songs"  
]
```

```
urlset = ET.Element(  
    "urlset",  
    xmlns="http://www.sitemaps.org/schemas/sitemap/0.9"  
)
```

```
for url in urls:  
    url_element = ET.SubElement(urlset, "url")  
    loc = ET.SubElement(url_element, "loc")
```

```
loc.text = url

xml_output = ET.tostring(
    urlset,
    encoding="unicode"
)

xml_output = '<?xml version="1.0" encoding="UTF-8"?>\n' + xml_output

print(xml_output)
```

How it works

1. A list of URLs is stored in the `urls` array.
2. The script creates a `<urlset>` element.
3. It loops through every URL.
4. Each URL is placed inside a `<loc>` element.
5. Finally, the complete XML sitemap is printed.

This simulates how a real website could generate a sitemap dynamically from a database.

5. Submit sitemap to Google Search Console

If you have your own verified website, follow these steps:

Step 1

Open [Google Search Console](#).

Step 2

Select your verified website property.

Step 3

In the left-hand menu, select **Sitemaps**.

Step 4

Enter:

sitemap.xml

in the sitemap field.

Step 5

Click **Submit**.

Step 6

Check the status shown by Search Console.

For a successful submission, you should see the sitemap listed with a status such as **Success**.

Site speed optimization

1. Google PageSpeed Insights – LCP, INP and CLS

Website selected: Zomato homepage

Open [Google PageSpeed Insights](#), enter the Zomato homepage URL, and run the test.

Record the results like this:

Core Web Vital	Result
LCP (Largest Contentful Paint)	_____ seconds
INP (Interaction to Next Paint)	_____ ms
CLS (Cumulative Layout Shift)	_____

What they mean

- **LCP:** Measures how quickly the largest visible content element loads.
- **INP:** Measures how quickly the page responds to user interactions.
- **CLS:** Measures unexpected movement of content while the page loads.

2. Image compression using TinyPNG or Squoosh

You can use [TinyPNG](#) or [Squoosh](#).

Example format

Suppose you have an image called `food.jpg`.

Measurement	Original	Optimized
File size	1.8 MB	620 KB
Loading time	420 ms	190 ms

Percentage size reduction:

[
 $\frac{1.8 - 0.62}{1.8} \times 100 \approx 65.6\%$
]

Short explanation

I compressed a JPG image using an image-compression tool. The original image was 1.8 MB, while the optimized image was 620 KB. The optimized image was approximately 65.6% smaller. The smaller file size can reduce the amount of data the browser needs to download and may improve loading performance.

3. Browser caching using `.htaccess`

If your website uses **Apache**, add the following to your `.htaccess` file:

```
<IfModule mod_expires.c>
    ExpiresActive On

    ExpiresByType image/jpeg "access plus 1 month"
    ExpiresByType image/png "access plus 1 month"
    ExpiresByType image/gif "access plus 1 month"
    ExpiresByType image/webp "access plus 1 month"
</IfModule>
```

Explanation

The `ExpiresByType` directives tell the browser that image files can be cached for **one month**.

For example:

```
ExpiresByType image/jpeg "access plus 1 month"
```

means JPEG images can remain cached in the user's browser for one month.

SEO/performance benefit

When a returning visitor opens the website, the browser may load cached images instead of downloading them again. This can reduce network requests and improve page loading performance.

4. Cloudflare CDN and caching

You can create a free account on [Cloudflare](#) and connect a domain that you own/control.

Steps

1. Create a Cloudflare account.
2. Add your test/personal domain.
3. Follow Cloudflare's instructions to update your domain's nameservers.
4. Wait until the domain becomes active on Cloudflare.
5. Check the caching/CDN settings.
6. Test your website before and after Cloudflare using [GTmetrix](#) or PageSpeed Insights.
7. Record the results.

Assignment table

Test	Before Cloudflare	After Cloudflare
Page load time	___ sec	___ sec
Performance score	___	___
LCP	___ sec	___ sec

Short conclusion

I connected my test website to Cloudflare and enabled its CDN/caching features. I tested the website before and after the configuration using an online performance-testing tool. The results were ___ before and ___ after. The comparison shows whether CDN and caching improved the website's loading performance.

5. LCP, INP and CLS with real user-experience examples

Metric	Full Form	What it Measures	Example of Poor UX
LCP	Largest Contentful Paint	How quickly the main/largest visible content loads	On a shopping app, the product image or main banner takes several seconds to appear, leaving the user staring at a blank/loading area.
INP	Interaction to Next Paint	How quickly the page responds to user interactions	On a ticket-booking app, a user taps “Book Now” , but the page takes a long time to respond, making them tap repeatedly.
CLS	Cumulative Layout Shift	How much visible content unexpectedly moves during loading	On an e-commerce page, a user tries to tap “Add to Cart” , but an image/banner loads and pushes the button somewhere else.

Short conclusion

LCP, INP, and CLS are important Core Web Vitals for measuring a website's user experience. A good LCP provides faster visual loading, a good INP provides quick interaction responses, and a good CLS keeps the page visually stable. Improving all three can make websites easier and more pleasant to use.

Mobile SEO

1. Mobile vs Desktop comparison

Website selected: Myntra

I opened the Myntra website on both mobile and desktop and observed these differences:

Feature	Desktop	Mobile
Navigation	More categories and navigation options are visible across the top.	Navigation is more compact and uses a mobile-friendly layout.
Product display	More products can fit across the screen at the same time.	Products are displayed in fewer columns so they are easier to view on a small screen.
Search & controls	Search bar, account and other controls have more space.	Search and other controls are arranged to fit a narrow screen and are easier to operate with touch.

Relation to mobile-first indexing

Google primarily uses the **mobile version of a website's content** for indexing and ranking. Therefore, important content, links, structured data, and other SEO elements should be available and usable on the mobile version as well.

A responsive design helps ensure that the same important content is accessible to both mobile users and search engines.

2. Responsive HTML page for a "Foodie Review" app

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <title>Foodie Review</title>

  <style>
    * {
      box-sizing: border-box;
    }

    body {
      margin: 0;
      font-family: Arial, sans-serif;
    }

    nav {
      background: #333;
      display: flex;
      justify-content: center;
    }

    nav a {
      color: white;
      text-decoration: none;
      padding: 15px 25px;
      display: block;
    }

    nav a:hover {
      background: #555;
    }

    .hero {
      text-align: center;
```

```

        padding: 50px 20px;
    }

    .hero h1 {
        font-size: 40px;
    }

    /* Mobile styles */
    @media only screen and (max-width: 600px) {

        nav {
            flex-direction: column;
            text-align: center;
        }

        nav a {
            width: 100%;
            padding: 12px;
        }

        .hero {
            padding: 30px 15px;
        }

        .hero h1 {
            font-size: 28px;
        }
    }
</style>
</head>

<body>

    <nav>
        <a href="#">Home</a>
        <a href="#">Restaurants</a>
        <a href="#">Reviews</a>
        <a href="#">Contact</a>
    </nav>

    <section class="hero">
        <h1>Welcome to Foodie Review</h1>
        <p>Discover restaurants, explore menus and read honest food reviews.</p>
    </section>

```

```
</body>  
</html>
```

How the media query works

The following rule applies when the screen width is **600px or less**:

@media only screen and (max-width: 600px)

It changes the navigation from a horizontal layout to a **vertical mobile-friendly menu**.

3. Google's Mobile-Friendly Test

Google's old standalone **Mobile-Friendly Test** has been retired. For a current mobile usability check, use **Google Search Console's Mobile Usability/Page Experience reports** or PageSpeed Insights.

For your assignment, you can write the following format after testing a page you have access to:

Website tested: Flipkart

Tool used: Google PageSpeed Insights / Google Search Console

Example issues to look for

1. **Text too small to read**
Small text can force mobile users to zoom in, creating a poor reading experience.
2. **Links or buttons too close together**
Closely placed touch targets can make it difficult for users to tap the correct link or button.

4. Basic AMP Movie Ticket Booking page

You can create an AMP HTML file such as `movie-booking.html`:

```
<!doctype html>
<html amp lang="en">

<head>
  <meta charset="utf-8">

  <script async src="https://cdn.ampproject.org/v0.js"></script>

  <link rel="canonical"
        href="https://example.com/movie-booking.html">

  <meta name="viewport"
        content="width=device-width,minimum-scale=1,initial-scale=1">

  <style amp-boilerplate>
    body {
      -webkit-animation: -amp-start 8s steps(1,end) 0s 1 normal both;
      animation: -amp-start 8s steps(1,end) 0s 1 normal both;
    }

    @-webkit-keyframes -amp-start {
      from { visibility: hidden }
      to { visibility: visible }
    }

    @keyframes -amp-start {
      from { visibility: hidden }
      to { visibility: visible }
    }
  </style>

  <noscript>
    <style amp-boilerplate>
      body {
        -webkit-animation: none;
        animation: none;
      }
    </style>
  </noscript>
```

```
<style amp-custom>
  body {
    font-family: Arial, sans-serif;
    margin: 0;
    padding: 20px;
    text-align: center;
  }

  h1 {
    font-size: 32px;
  }

  .button {
    display: inline-block;
    padding: 12px 20px;
    background: #e63946;
    color: white;
    text-decoration: none;
  }
</style>

<title>Movie Ticket Booking</title>
</head>

<body>

  <h1>Book Movie Tickets Online</h1>

  <amp-img
    src="https://example.com/images/movie-poster.jpg"
    width="600"
    height="800"
    layout="responsive"
    alt="Movie poster">
  </amp-img>

  <p>Find movies near you and book your tickets online.</p>

  <a href="#" class="button">Book Tickets</a>

</body>
</html>
```

5. Mobile SEO checklist and improvements

For a trusted reference, you can use Google's documentation on mobile-first indexing and page experience:

[Google Search Central – Mobile-first indexing](#)

Sample mobile SEO checklist

Checklist item	My site	Improvement needed
Responsive design	Yes/No	Make layout responsive
Mobile-friendly navigation	Yes/No	Simplify navigation
Fast page loading	Yes/No	Compress images
Readable text	Yes/No	Increase font size where needed
Touch-friendly buttons	Yes/No	Increase spacing between buttons
Optimized images	Yes/No	Compress JPG/PNG images
HTTPS	Yes/No	Enable HTTPS
Mobile viewport	Yes/No	Add viewport meta tag

Three specific improvements

1. Compress images

Large images can increase page-load time. I would compress images and use appropriately sized formats so that mobile users don't download unnecessarily large files.

2. Improve mobile navigation

I would simplify the navigation and make buttons/links large enough to tap comfortably on a phone.

3. Improve page speed

I would reduce unnecessary CSS/JavaScript, enable browser caching, and optimize images to improve loading performance and Core Web Vitals.

Short conclusion

After reviewing my website using a mobile SEO checklist, I identified three main areas for improvement: image optimization, mobile navigation, and page speed. Improving these areas can provide a better mobile user experience and support better technical SEO.

Google search console

1. Set up Google Search Console and verify ownership

Use a demo website that you own, such as a GitHub Pages site.

Open [Google Search Console](#).

Steps

1. Sign in with your Google account.
2. Click **Add property**.
3. Enter your website URL.
4. Select the appropriate property type.
5. Choose **HTML tag** as the verification method.
6. Google will provide a meta tag similar to:

```
<meta name="google-site-verification"  
  content="YOUR-VERIFICATION-CODE">
```

7. Add this tag inside the `<head>` section of your homepage.
8. Save and publish your website.
9. Return to Search Console.
10. Click **Verify**.

2. Submit the sitemap

First, make sure your website has a sitemap such as:

`https://yourwebsite.com/sitemap.xml`

In Google Search Console:

1. Select your website property.
2. Go to **Sitemaps**.
3. Enter:

`sitemap.xml`

4. Click **Submit**.
5. Wait for Google to process it.

Assignment table

Sitemap	Status
<code>sitemap.xml</code>	Success

3. Find the top 3 queries

Go to:

Search Console → **Performance** → **Search results**

Set the date range to:

Last 28 days

Select the **Queries** tab.

Record the first three queries according to **Clicks**.

Fill in this table with your actual results:

Rank	Search Query	Total Clicks
1	_____	_____
2	_____	_____
3	_____	_____

4. URL Inspection and Request Indexing

In Google Search Console:

1. Open **URL Inspection**.
2. Enter one of your website URLs, for example:

<https://yourwebsite.com/>

3. Press Enter.
4. Check the indexing status.
5. Click **Request Indexing** if available.
6. Wait for Google's test to finish.

Record the result like this:

URL inspected:

<https://yourwebsite.com/>

Indexing status:

Request indexing:

Successful / Not available

Issues or suggestions:

Example answer

I used the URL Inspection tool to inspect my homepage. Google Search Console showed the current indexing status and allowed me to request indexing. I did not receive any major issues, although Google indicated that indexing is not guaranteed immediately after submitting the request.

5. Find exactly 8-word queries using Regex

Go to:

Performance → Search results → Queries

Then:

1. Click **+ New** or the Query filter.
2. Select **Custom (regex)**.
3. Enter:

```
^(\b\w+\b\s){7}\b\w+\b$
```

This pattern is better than the assignment's shorter pattern because it matches **exactly 8 words**, rather than simply checking for seven word-space combinations.

What it means

```
(\b\w+\b\s){7}
```

= seven words followed by spaces

and:

```
\b\w+\b
```

= the eighth word.

The **^** and **\$** make sure the **entire query** matches the pattern.

Site Audit with AI tools

1. Basic SEO audit of a local restaurant website

Website selected: A local restaurant website

Use an AI-powered SEO tool such as [Semrush](#) or [Ahrefs](#), enter the restaurant's website, and run a **Site Audit**.

Example audit table

No.	Technical SEO Issue	Impact
1	Missing or poorly optimized meta descriptions	Search results may have less useful snippets, reducing clicks.
2	Missing/duplicate title tags	Search engines may have difficulty understanding the purpose of pages.
3	Broken internal links	Users and search-engine crawlers may reach unavailable pages.
4	Missing or incorrect alt text on images	Search engines have less information about important images.
5	Slow page loading / poor Core Web Vitals	A slow website can provide a poor user experience and hurt search performance.

Short conclusion

The site audit identified several technical SEO issues, including metadata problems, broken links, image optimization issues, and page-speed concerns. Fixing these issues can improve crawlability, user experience, and overall SEO performance

2. Screaming Frog crawl and CSV export

Download [Screaming Frog SEO Spider](#).

Steps

1. Install Screaming Frog SEO Spider.
2. Open the application.
3. Enter:

`https://www.myntra.com/`

4. Click **Start**.
5. Allow the crawler to complete.
6. Go to the **Internal** tab.
7. Review the URLs discovered.
8. Click **Export**.
9. Save the file as:

`myntra-crawl-urls.csv`

Example CSV structure

Your exported CSV may contain columns similar to:

Address	Content Type	Status Code	Indexability
<code>https://www.myntra.com/</code>	text/html	200	Indexable
<code>/men</code>	text/html	200	Indexable
<code>/women</code>	text/html	200	Indexable
<code>/kids</code>	text/html	200	Indexable

3. Prioritize three important e-commerce SEO issues

After completing the Screaming Frog crawl, prioritize the issues like this:

Priority	Issue	Why it matters
1 – High	Broken links / 4xx pages	Users may reach unavailable pages, and crawlers can waste time following broken links.
2 – High	Duplicate or missing title tags	Titles help search engines understand pages and influence how pages appear in search results.
3 – Medium/High	Missing meta descriptions	They don't directly determine rankings, but poor snippets can reduce organic click-through rates.

Why these are important for an online shopping site

An e-commerce website can have thousands of product and category pages. Even relatively small technical problems can occur across many URLs. Fixing problems that affect **crawlability**, **page relevance**, and **user experience** should therefore receive the highest priority.

4. Short SEO audit report – music streaming site

SEO Audit Report – Music Streaming Website

Website: Example music streaming website

Audit focus: Technical SEO

Main Issues and Recommended Fixes

1. Slow Page Loading

Large images, JavaScript files, and other resources can make pages load slowly.

Recommended fix: Compress images, reduce unnecessary JavaScript, enable caching, and improve Core Web Vitals.

2. Duplicate Page Titles

Different artist, album, or playlist pages may have similar or duplicate title tags.

Recommended fix: Create unique and descriptive title tags for every important page.

3. Missing Meta Descriptions

Some pages may not have useful meta descriptions.

Recommended fix: Write unique, keyword-relevant meta descriptions that accurately describe each page.

4. Broken Internal Links

Old songs, albums, or artist pages may contain links that lead to unavailable URLs.

Recommended fix: Find broken links using a crawler and replace them with working URLs or appropriate redirects.

5. Poor Image Optimization

Large album covers and promotional images can increase page size.

Recommended fix: Compress images and use modern formats and appropriate dimensions.

Conclusion

The main SEO priorities are improving page speed, fixing broken links, and creating unique metadata. These changes can improve crawlability, user experience, and the visibility of important music, artist, album, and playlist pages in search engines.

5. Analyze a sample web server log

You can create a small sample log yourself for this assignment:

```
66.249.66.1 - - [19/Aug/2026:10:15:22 +0530] "GET / HTTP/1.1" 200 5421 "-" "Googlebot/2.1"
66.249.66.1 - - [19/Aug/2026:10:15:25 +0530] "GET /products HTTP/1.1" 200 8421 "-"
"Googlebot/2.1"
192.0.2.15 - - [19/Aug/2026:10:16:02 +0530] "GET /old-product HTTP/1.1" 404 1200 "-"
"Mozilla/5.0"
192.0.2.20 - - [19/Aug/2026:10:16:05 +0530] "GET /admin/login HTTP/1.1" 404 1100 "-"
"BadBot/1.0"
192.0.2.20 - - [19/Aug/2026:10:16:06 +0530] "GET /wp-login.php HTTP/1.1" 404 1100 "-"
"BadBot/1.0"
192.0.2.20 - - [19/Aug/2026:10:16:07 +0530] "GET /admin/config HTTP/1.1" 404 1100 "-"
"BadBot/1.0"
```

Sample AI summary

AI Summary: The log shows normal crawling activity from Googlebot, which successfully accessed the homepage and product page with HTTP 200 responses. There is also a series of requests from the same **BadBot/1.0** user agent attempting to access administrative URLs such as **/admin/login**, **/wp-login.php**, and **/admin/config**. All of these requests returned 404 responses. This repeated access to administrative paths may indicate automated scanning or unusual bot activity. There is also one normal user-agent request that resulted in a 404 for **/old-product**.

Do I agree with the AI?

Yes, mostly.

The repeated requests from the same bot to administrative URLs are unusual compared with the Googlebot requests and could indicate automated scanning. However, the log alone does **not prove that the bot is malicious**. The 404 responses show that those requested resources were not found, which is useful evidence but not proof of an attack.

Final conclusion

I agree with the AI's identification of unusual bot activity, because the same user agent repeatedly requested administrative URLs within a short period. I would

investigate the IP address, request frequency, user-agent behavior, and other server logs before making a final security decision.
