

DAL ANUSHA

DM-Google Ads & performance marketing

INTRODUCTION TO PPC

1. Create a table comparing Pay Per Click (PPC) advertising with organic search results, using examples from Google Search results for 'best headphones'. List at least 3 differences.

basic	Ppc advertising	Organic search results
cost	Advertisers pays when someone clicks the Ad	No direct payment is required for each click
position	Usually appears prominently at the top of the search page and is marked " Sponsored. "	Appears below paid results based on Google's ranking system.
speed	Can start generating visibility soon after a campaign is launched	Usually takes time to build rankings through SEO and useful content
Example for best headphones	A headphone brand may display an ad promoting its headphones	A technology/review website may appear with an article such as "Best Headphones."
control	Advertiser can control budget,keywords,audience and ad message	Rankings depend mainly on relevance, content quality and SEO factors.

2. Write a short scenario explaining how a Flipkart seller could use PPC ads to increase sales of a new smartphone model. Mention the keywords they might target and the expected outcome

Scenario

A seller on Flipkart launches a new smartphone and wants to increase its visibility and sales. Since the phone is new, it may not immediately appear high in organic search results. The seller can use PPC advertising to promote the product to customers who are actively searching for smartphones.

Target keywords could include:

- New smartphone
- Best smartphone
- Budget smartphone
- Smartphone with good camera
- Smartphone under ₹20,000
- Buy smartphone online

The seller can create attractive ads highlighting features such as the camera, battery, storage, price and launch offer. When users click the advertisement, they can be directed to the smartphone's product page.

Expected outcome:

The PPC campaign could increase product visibility, website/product-page visits, and potentially generate more sales and brand awareness. Google Ads allows advertisers to bid on keywords and pay when users click their advertisements.

3. List 3 advantages and 2 disadvantages of using PPC advertising for a new Zomato-style food delivery app launch.

Advantages

1. **Quick visibility:** PPC can help a new app appear prominently when people search for food delivery services.
2. **Targeted advertising:** The app can target specific locations, keywords and audiences.
3. **Measurable results:** Advertisers can monitor clicks, conversions and campaign performance and adjust their campaigns accordingly.

Disadvantages

1. **Can be expensive:** Popular keywords such as “food delivery” can have strong competition, increasing advertising costs.
2. **Traffic can stop when the budget ends:** Unlike organic visibility, PPC traffic generally depends on continuing to run and fund the advertisements.

4. Use ChatGPT to generate a list of 5 catchy Google Ads headlines for promoting a new IPL cricket fantasy league app. Paste the AI's suggestions.

Possible headlines:

1. Get Live Cricket Scores Fast
2. Never Miss a Cricket Update
3. Follow Every Match Live
4. Your Cricket Updates, All in One App
5. Stay Updated With Every Cricket Match

Google Ads Account Set up,Campaign Types and Objectives,Keyword Match Types

1.List three campaign types available in Google Ads and, for each, give a real-world example using an app you use daily (e.g., promote a new Zomato offer, advertise a Flipkart sale, or get more installs for a music app like Spotify).

Campaign type	description	Real world examples
Search campaign	Displays text ads when people search for relevant keywords on Google.	Zomato: Promote a special food-delivery offer when users search for “food delivery near me.”
Display campaign	Shows visual advertisements across websites and apps that are part of Google's advertising network.	Flipkart: Promote a Big Sale using banner advertisements on relevant websites.
App campaign	Helps promote an app and encourage users to install or engage with it.	Spotify: Promote the Spotify app to increase new app installations.

2.Choose a campaign objective in Google Ads (like Website Traffic, App Promotion, or Leads) and explain in 3-4 lines how this objective would help a brand like Myntra or BookMyShow achieve its marketing goals.

Campaign Objective – Website Traffic

Example: Myntra

Chosen Objective: Website Traffic

Myntra can use the Website Traffic objective to bring more potential customers to its website. It could create ads targeting keywords such as “buy clothes online,” “Myntra sale,” and “latest fashion trends.” More relevant visitors can increase product views and give Myntra more opportunities to generate purchases.

Expected result: Increased website visits, product views, and potential sales.

3.For the keyword 'online food delivery', write one example each for Broad Match, Phrase Match, and Exact Match types as you would enter them in Google Ads.

Hint: Use the correct syntax for each match type (no symbols, quotes, or brackets for Broad Match; quotes for Phrase Match; square brackets for Exact Match).

Match type	Google Ads syntax	example
Broad match	No symbols	Online food delivery
Phrase match	Quotation marks	“Online food delivery”
Exact match	Square brackets	[Online food delivery]

Explanation

- Broad Match: Can reach searches related to the keyword, including variations and related searches.
- Phrase Match: Targets searches that contain the meaning of the keyword phrase.
- Exact Match: Provides more precise targeting for searches closely related to the specified keyword.

3. Use ChatGPT to generate a list of 10 potential keywords for a campaign promoting a new cricket score app during IPL season, then categorize each keyword as either Broad, Phrase, or Exact Match type.

NO	KEYWORD	MATCH TYPE
1	Cricket score App	broad
2	Live cricket score	broad
3	IPL live score	broad
4	Cricket score live	phrase
5	IPL live scores	phrase
6	Live IPL match score	phrase
7	IPL score today	phrase
8	[live cricket score App]	Exact
9	[IPL live score]	Exact
10	[cricket score App]	Exact

Bidding & Budgeting, Search & Display Campaigns, Remarketing Concepts

1. Create a mock Google Search campaign for a new food delivery app, setting a daily budget of ₹500 and choosing the 'Maximize Clicks' bidding strategy. List which keywords you would target and explain why.

setting	Details
Campaign type	Search campaigns
App/brand	Fresh bites-new food delivery App
Daily budget	500 per day
Bidding strategy	Maximize clicks
Main goal	Increase website visits and attract potential customers

Keywords to target

<u>keyword</u>	<u>Reason for targeting</u>
Online food delivery	Targets users actively looking for food delivery services.
Food delivery near me	Reaches users for looking nearby delivery options
Order food online	Target people who are ready to get food
Food delivery online	Reaches users searching for a food delivery option
Best food delivery app	Target users comparing different

	food delivery options
Fast food delivery	Attract customers who value quick delivery
Restaurant food delivery	Target users wanting restaurants meals delivered to them

Explanation

The Maximize Clicks bidding strategy would be suitable for the initial campaign because the main aim is to generate as many relevant visits as possible within the ₹500 daily budget. The selected keywords focus on people who are already searching for food delivery services. This can help the new app build awareness and bring potential customers to its website or app.

Expected outcome: More relevant clicks, increased brand awareness, and potential new customers.

2.Design a Display campaign banner for a new headphones launch on an e-commerce site like Flipkart. Specify the target audience, placements, and write the main headline and description you would use.

Campaign Details

Product: New Wireless Headphones

Platform: E-commerce website such as Flipkart

Campaign Type: Display Campaign

Target Audience

- Students and young adults
- Music and podcast listeners
- People interested in headphones and audio products
- Online shoppers looking for electronics
- Users interested in smartphones and gadgets

Placements

The advertisements could appear on:

- Technology websites
- Music-related websites
- Gadget review websites
- Shopping websites and apps
- YouTube-related placements
- Relevant mobile apps

Banner Content

Main Headline:

“Experience Sound Like Never Before!”

Description:

“Meet the new wireless headphones with powerful sound, comfortable design and long-lasting battery life.”

Call to Action:

“Shop Now”

Banner Concept

The banner could show the new headphones prominently with a clean background, product features such as **“Wireless • Powerful Sound • Long Battery”**, and a **Shop Now** button.

3. Given a scenario where your Zomato-style app is getting lots of clicks but few conversions, adjust your campaign's bidding strategy and budget allocation to improve performance. Write out the steps you would take and justify each change.

Hint: Consider switching to a 'Target CPA' or 'Maximize Conversions' bid strategy and reallocating budget to better-performing ad groups.

Situation

Suppose the food delivery app receives many clicks but very few users actually place orders. This means the campaign is attracting visitors but is not converting enough of them into customers.

Steps I Would Take

Step 1 – Check conversion tracking

First, I would make sure that important actions such as app installs, sign-ups and completed food orders are being tracked correctly. This ensures that campaign decisions are based on accurate data.

Step 2 – Analyze ad groups and keywords

I would identify which keywords and ad groups generate actual orders rather than just clicks. Keywords producing many clicks but very few conversions would be reviewed or reduced.

Step 3 – Move toward conversion-focused bidding

Instead of focusing mainly on clicks, I would test **Maximize Conversions** once sufficient conversion data is available. This strategy focuses Google's bidding toward users more likely to complete a conversion.

Step 4 – Consider Target CPA

If the campaign has enough reliable conversion data, I could test **Target CPA** and set a reasonable target cost for each completed order or other defined conversion.

Step 5 – Reallocate the budget

I would move more of the daily budget toward the best-performing

campaigns/ad groups and reduce spending on areas that generate clicks without conversions.

Step 6 – Improve the landing page/app experience

I would check whether users are leaving because of slow loading, complicated ordering, unclear offers, or unexpected delivery charges.

Justification

The objective is to shift the campaign from “**getting more clicks**” to “**getting more valuable actions**.” By identifying high-performing keywords, improving the customer journey, and using conversion-focused bidding, the app can potentially improve its conversion rate and make better use of its advertising budget.

4.Explain how you would set up a remarketing campaign to target users who visited your IPL ticket booking page but did not complete the purchase. Include which audience you would create and what ad message you would show.

Campaign Goal

The goal is to bring back users who visited the IPL ticket booking page but did not complete their ticket purchase.

Audience to Create

I would create an audience called:

“IPL Ticket Page Visitors – No Purchase”

The audience would include users who:

- Visited the IPL ticket booking page.
- Did not complete the ticket purchase.
- Can be reached through eligible remarketing channels.

Users who already completed a purchase should be excluded from this audience so that advertising budget isn't unnecessarily spent on them.

Remarketing Ad Message

Headline:

“Still Planning to Watch the IPL?”

Description:

“Don’t miss the excitement! Check available IPL tickets and book your match experience today.”

Call to Action:

“Book Tickets”

How It Works

1. Add the appropriate remarketing tag/audience setup to the ticket-booking website.
2. Create an audience of people who visited the booking page.
3. Create a separate audience of users who completed a purchase.
4. Exclude purchasers from the remarketing audience.
5. Create a Display/remarketing campaign.
6. Show relevant IPL ticket advertisements to the remaining visitors.
7. Monitor conversions and cost per purchase.
8. Adjust the campaign based on performance.

Expected outcome: The campaign aims to bring interested visitors back to the booking page and encourage them to complete their purchase.

Google Merchant Center, Google AdSense & Admob

1. Research and list 3 major policy requirements you must follow when using Google AdSense on a website that reviews mobile apps, and explain why each is important.

1. Follow Google's content policies

The website should contain original, useful and policy-compliant content. App reviews should not contain prohibited or harmful material.

Why it is important:

Following content policies helps the website remain eligible to display AdSense advertisements and reduces the risk of policy violations.

2. Don't encourage or manipulate ad clicks

The website owner must not click their own ads or ask visitors to click advertisements. Ads should also not be placed in a way that tricks users into clicking them.

Why it is important:

Artificial clicks can create invalid traffic and may result in advertising restrictions or account action.

3. Have clear and trustworthy website content

An app-review website should provide genuine reviews and useful information rather than misleading users. It should also provide appropriate website information such as a privacy policy where required.

Why it is important:

Clear and trustworthy content improves the user experience and helps the site meet Google's publisher requirements.

2. Use ChatGPT to generate a checklist for optimizing a Google Merchant Center product feed for maximum visibility and compliance, then review and apply at least 2 suggestions to your mock product listing.

NO	OPTIMIZATION SUGGESTIONS	PURPOSE
1	Use a clear and descriptive title	Helps Google understand the product.
2	Provide accurate product descriptions	Gives customers useful information
3	Use high quality image	Improves product presentation.
4	Keep prices accurate and up to date	Prevents mismatches between the feed and website.
5	Keep availability status accurate	Prevents customers from seeing unavailable products.
6	Include the correct brand	Helps identify the product
7	Use correct google product category	Improves product classification.
8	Avoid misleading information	Helps maintain policy compliance.
9	Keep landing-page information consistent with the feed	Creates a better customer experience
10	Fix merchant center warning and errors	Helps products remain eligible for visibility.

AI assisted Ad Copy And Creative Ideation

1. Use ChatGPT to generate 5 unique Google Search ad headlines for a new food delivery app in your city (think Zomato/Swiggy competitor). Copy the best 3 into a Google Doc and explain in 1-2 lines why you think each would attract clicks.

App name: FoodGo

City: Ahmedabad

5 Generated Headlines

1. Order Food Online in Ahmedabad
2. Hot Meals Delivered to Your Door
3. Discover Food Near You
4. Fast Food Delivery at Great Prices
5. Your Favorite Food, Delivered Fast

Best 3 Headlines and Why

1. Order Food Online in Ahmedabad

This headline directly mentions the service and city, making it highly relevant to people searching for food delivery in Ahmedabad.

2. Hot Meals Delivered to Your Door

It highlights convenience and immediately tells users the main benefit of the app.

3. Fast Food Delivery at Great Prices

This combines two strong reasons to click: fast delivery and attractive prices.

2. Write 2 versions of a Google Ads description for a Flipkart-style online electronics sale, one focused on discounts and one focused on fast delivery. Compare which version you think would perform better and why.

Hint: Consider what motivates users to click: savings or convenience?

Version 1 – Discount Focused

“Big electronics sale is here! Get exciting discounts on smartphones, laptops, headphones and more. Shop today and save more.”

Version 2 – Fast Delivery Focused

“Shop the latest electronics online and get your order delivered quickly to your doorstep. Easy shopping, fast delivery and great products.”

Comparison

version	Main focus	Expected strength
Version 1	Discount and savings	More likely to attract price conscious customer
Version 2	Convenience and fast delivery	More likely to attract shoppers to who value speed

Which Would Perform Better?

I would choose **Version 1 – Discount Focused** for an electronics sale. Discounts are a strong motivation for online shoppers, especially during a sale, and the message immediately communicates a financial benefit.

Note: Actual performance would depend on the audience, offer, keywords, landing page and campaign data, so an advertiser should test both versions rather than assume one will always win.

3. Find an Instagram ad for a mobile app (any category: music, shopping, payments, etc). Rewrite the main ad text to fit Google Search ad format (1 headline + 1 description), keeping the original message but adapting for search intent.

Example: Spotify-style Music App

Original Instagram message – idea:

Discover and listen to music that matches your mood and interests.

Google Search Ad

Headline:

Discover Music You Love

Description:

Listen to songs and discover new music based on your favorite artists, moods and playlists.

Why This Works

The original message is kept, but the Search ad is made more direct because people searching on Google usually have a specific intention. The headline focuses on the main benefit, while the description explains what the app offers.

4.Brainstorm 3 creative ideas for Google Display Ads (banner visuals + short text) to promote a new IPL cricket fantasy league app. For each, describe the main image you'd use and write the banner text.

Constraint: Keep banner text under 8 words for maximum impact.

Idea 1 – Live Score

Main Image: A smartphone showing a live cricket score during an IPL match.

Banner Text:

“Every IPL Score, Live”

Idea 2 – Match Updates

Main Image: A cricket stadium with a phone displaying live match updates.

Banner Text:

“Never Miss A Match”

Idea 3 – Cricket Alerts

Main Image: A smartphone showing a cricket notification/score alert.

Banner Text:

“Get IPL Updates Instantly”

All three banner texts contain **fewer than 8 words** and communicate the app's benefit quickly.

Using Chatgpt For Headlines,Description and A/B ideas

1.Use ChatGPT to generate 10 catchy headline options for a Flipkart Diwali Sale Google Search Ad targeting mobile shoppers. Copy your 3 favorite headlines into a document.

Flipkart Diwali Sale – Google Search Ad Headlines

Campaign: Flipkart Diwali Sale

Target Audience: Mobile shoppers in India

10 Catchy Headline Options

1. Flipkart Diwali Sale Is Here!
2. Diwali Deals on Top Mobiles
3. Get Amazing Mobile Deals
4. Upgrade Your Phone This Diwali
5. Big Diwali Savings on Mobiles
6. Shop Smartphones at Great Prices
7. Diwali Sale – Mobile Deals
8. Grab the Best Phone Deals
9. Festive Offers on Smartphones
10. Shop More, Save More This Diwali

My 3 Favorite Headlines

1. **Diwali Deals on Top Mobiles**
2. **Upgrade Your Phone This Diwali**
3. **Big Diwali Savings on Mobiles**

2. Write a Google Ads description (max 90 characters) for a Zomato food delivery offer, then use ChatGPT to suggest 3 alternative phrasings focused on speed, savings, or variety.

Hint: Ask ChatGPT to "rewrite this description with a focus on [your chosen angle]"

Original Description

Order your favorite food now and enjoy delicious meals delivered fast!

3 Alternative Phrasings

focus	Google ADS description
speed	Get your favorite meals delivered fast, fresh, and right to your door!
saving	Enjoy tasty meals at great prices with exciting food delivery offers!
variety	Explore delicious dishes from your favorite restaurants, all in one place!

Comparison:

The speed version highlights convenience and quick delivery. The savings version attracts price-conscious customers, while the variety version appeals to users who want more food choices.

3. Pick a Myntra fashion sale campaign. Use ChatGPT to brainstorm 2 different A/B test ideas for ad headlines or descriptions, explaining what user behavior or click metric each test could improve.

Myntra Fashion Sale – A/B Testing Ideas

Campaign: Myntra Fashion Sale

A/B Test 1 – Headline Test

Version A:

Big Fashion Sale – Shop Now!

Version B:

Trendy Styles at Amazing Prices

What to measure:

Click-Through Rate (CTR)

Expected result:

Version A creates urgency with “Shop Now,” while Version B focuses on style and pricing. Comparing CTR can show which message attracts more clicks.

A/B Test 2 – Description Test

Version A:

Discover the latest fashion styles and refresh your wardrobe today.

Version B:

Save more on trending fashion during our limited-time sale!

What to measure:

CTR and conversion rate.

Expected result:

Version A focuses on new fashion and discovery, while Version B focuses on savings and urgency. The test can show whether shoppers respond more strongly to fashion inspiration or discounts.

4.Take one of your ChatGPT-generated ad headlines and manually tweak it to better fit Indian Gen Z slang or emoji usage. Compare both versions and explain which you think would perform better and why.

Original Headline

Upgrade Your Phone This Diwali

Manually Tweaked Gen Z Version

Diwali Phone Upgrade? Let’s Go! 📱✨

Comparison

Original	Gen-z slang
Upgrade your phone this diwali	Diwali phone upgrade lets go!
Simple and professional	Casual and energetic
Suitable for abroad audience	More appealing to younger audience
No emojis	Use relevant emojis

Which Would Perform Better?

I think “Diwali Phone Upgrade? Let’s Go! 📱✨” could perform better with a younger Indian audience because it feels more casual, energetic, and relatable. The emojis also make the headline visually noticeable.

However, the original headline may be better for a broader audience because it is simple and professional. An actual A/B test would be needed to determine which headline gets the higher CTR.
