

DAL ANUSHA
MODULE:2 DM - WEBSITE,CONTENT AND AI CREATION

WORLD WIDE WEB

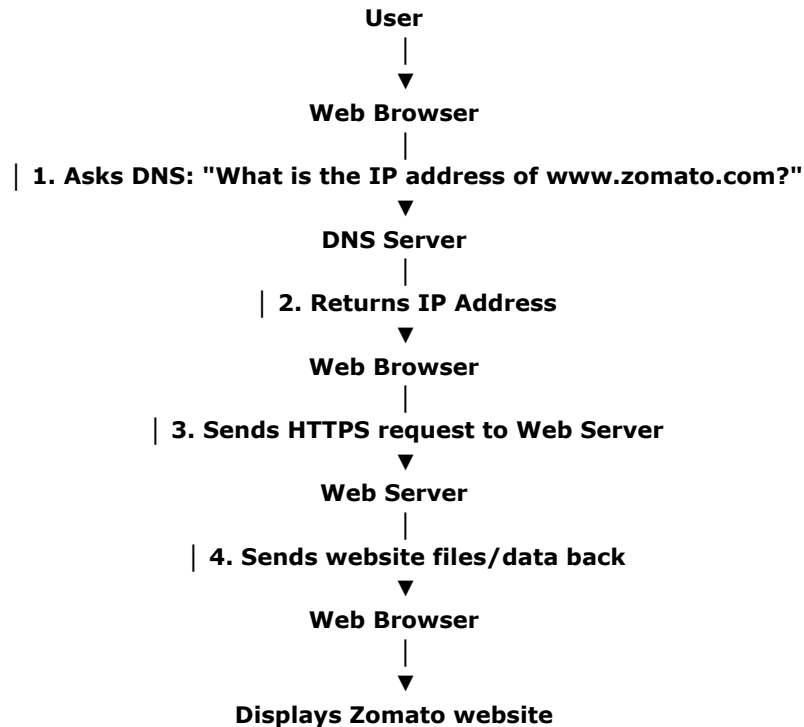

Tasks:

1. Open your browser and visit www.wikipedia.org, then note down the protocol, domain name, and top-level domain you see in the URL bar.

- 1 .protocol : https
2. Domain name : wikipedia
- 3.top level domain : .org

2. Create a diagram (hand-drawn or digital) that shows how a web browser, web server, and DNS interact when you type www.zomato.com into your browser and press Enter.

Hint: Include steps like DNS lookup, HTTP request, and server response.

- **Steps as given below:**

User enters **www.zomato.com**.

Browser asks the **DNS server** for the website's IP address.

DNS returns the IP address.

Browser sends an **HTTP/HTTPS request** to the web server.

The web server processes the request.

The server sends the webpage back.

The browser displays the webpage.

3. List 5 popular websites you use daily (like Instagram, Flipkart, IRCTC, etc.) and identify the type of website each one is (static, dynamic, or web application).

- Instagram :web application
- Flipkart: dynamic website
- IRCTC:web application
- Youtube:dynamic website
- Wikipedia:dynamic website

4.Explain the difference between HTTP and HTTPS by giving a real example of a site you use that shows the padlock icon in the browser.

HTTP sends data without encryption, so it is less secure. **HTTPS** encrypts data, making it safer and protecting your information.

For example, [Google](https://www.google.com/) uses **HTTPS** and shows a padlock icon in the browser, which means the connection is secure.
